The complexity of biological systems has intrigued scientists from many disciplines and has given birth to the highly influential field of systems biology wherein a wide array of mathematical techniques such as flux balance analysis and technology platforms such as next generation sequencing is used to understand elucidate and predict the functions of complex biological systems More recently the field of synthetic biology i e de novo engineering of biological systems has emerged Scientists from various fields are focusing on how to render this engineering process more predictable reliable scalable affordable and easy Systems and control theory is a branch of engineering and applied sciences that rigorously deals with the complexities and uncertainties of interconnected systems with the objective of characterising fundamental systemic properties such as stability robustness communication capacity and other performance metrics Systems and control theory also strives to offer concepts and methods that facilitate the design of systems with rigorous guarantees on these properties Over the last 100 years it has made stellar theoretical and technological contributions in diverse fields such as aerospace telecommunication storage automotive power systems and others Can it have or evolve to have a similar impact in biology The chapters in this book demonstrate that indeed systems and control theoretic concepts and techniques can have a significant impact in systems and synthetic biology Volume II contains chapters contributed by leading researchers in the field of systems and synthetic biology that concern modeling physiological processes and bottom up constructions of scalable biological systems The modeling problems include characterisation and synthesis of memory understanding how homeostasis is maintained in the face of shocks and relatively gradual perturbations understanding the functioning and robustness of biological clocks such as those at the core of circadian rhythms and understanding how the cell cycles can be regulated among others Some of the bottom up construction problems investigated in Volume II are as follows How should biomacromolecules platforms and scalable architectures be chosen and synthesised in order to build programmable de novo biological systems What are the types of constrained optimisation problems encountered in this process and how can these be solved efficiently As the eminent

computer scientist Donald Knuth put it biology easily has 500 years of exciting problems to work on This edited book presents but a small fraction of those for the benefit of 1 systems and control theorists interested in molecular and cellular biology and 2 biologists interested in rigorous modelling analysis and control of biological systems A-E Library of Congress. Binder,2011-07-21 In an era where humans affect virtually all of the earth s processes questions arise about whether we have sufficient knowledge of human environment interactions How can we sustain the Earth s ecosystems to prevent collapses and what roles should practitioners and scientists play in this process These are the issues central to the concept of environmental literacy This unique book provides a comprehensive review and analysis of environmental literacy within the context of environmental science and sustainable development Approaching the topic from multiple perspectives it explores the development of human understanding of the environment and human environment interactions in the fields of biology psychology sociology economics and industrial ecology The discussion emphasises the importance of knowledge integration and transdisciplinary processes as key strategies for understanding complex human environment systems HES In addition the author defines the HES framework as a template for investigating sustainably coupled human environment systems in the 21st century

Principles of Biological Regulation Richard Jones,2012-12-02 Principles of Biological Regulation An Introduction to Feedback Systems presents some understanding of control regulatory and feedback mechanisms in biological systems This book discusses concepts related to the dynamic behavior of both individual biological processes and systems of processes that make up an organism Comprised of 10 chapters the book also describes the characteristics of biological feedback systems focusing on the physical concepts After briefly dealing with involved regulatory processes in biological systems the book goes on discussing the flow or transport of material through a series of processes in the steady state Next chapter uses superposition principle to explain the changes that biological systems undergo following a disturbance or under dynamic behavior The subsequent chapters cover the fundamental principles of negative biological feedback and to the effects it produces both under steady state and dynamic behavior Other chapters describe the effect of sinusoid signals on biological processes and present some stability criteria applied to technological systems and also their value in the study of homeostatic processes The book also discusses some aspects of homeostats that seem to distinguish them from technological feedback systems These features include not only the components themselves and their organization but also the experimental problems involved in their study The concluding chapters describe nonlinear behavior with great relevance to homeostatic systems and rate processes production or destruction for which the roles of stimulus and initial conditions are different Mathematical relations developed from the conservation of mass and the mass action for chemical reactions are also presented The book is an invaluable resource for life scientists and researchers *Proceedings of the National Academy of Sciences of the United States of America* National Academy of Sciences (U.S.),National Academy of
