Advances in Production Management Systems E.

Eloranta, 2012-12-02 This book is divided into four sections invited papers principles systems and techniques The invited papers form an extensive overview of the state of the art of production management The themes range from the everlasting hunt for better productivity to the implications of CIM architectures particularly CIM OSA for production management The

other three sections of the book look at the various problems affecting production management. One of the characteristics of modern production management is the need for better principles, systems and techniques for interorganizational production management. Another topic of crucial relevance is the necessity to master not only repetitive manufacturing but also one of a kind product manufacturing. From the managerial point of view, the forecast based make to stock principles have proven insufficient with market forces demanding fast and reliable deliveries of customer oriented products. The goals of production management have been re-evaluated as a result.

Reinventing the Factory Roy L. Harmon, Leroy D. Peterson, 1990. The factory of the future is here. We have the technology and professional knowledge say leading manufacturing consultants Roy Harmon and Leroy Peterson to implement revolutionary concepts that many managers might regard as futuristic. In this path breaking book Harmon and Peterson move beyond theory to document more than a hundred real life applications of productivity improvement from the focused factory and assembly process design to the plantwide plan gathered from Andersen Consulting Arthur Andersen Co's offices around the world. The reorganization of existing plants into multiple factories within a factory is the single most important feature of productivity improvement according to Harmon and Peterson. These smaller units known as subplants are honed to the smallest practical size to ensure the highest level of productivity. Multiple subplants can be clustered to focus accountability and authority for production of product families into easily managed groups of processes. With hundreds of diagrams and using examples of companies that operate focused factories in dozens of countries Harmon and Peterson detail both the physical and organizational changes required to make the focused factory a successful and profitable feature of a plant's modernization. In addition to creating subplants and subplant clusters Harmon and Peterson show how manufacturers can dramatically increase productivity by adopting a plantwide plan. In its most basic form the plantwide plan is a layout of a single factory. It includes to the extent practical not only the ideal layout but also step by step strategies for movement of individual processes from their current locations in the factory to final target destinations. Harmon and Peterson explain how managers can use the plantwide plan to eliminate the common problem of compromising ideals too early to accommodate assumed constraints and turn an existing factory into a competitive factory of the future. Today flexibility, creativity and dynamic planning are key concepts for attaining superior manufacturing results. For plant modernization to be profitable the organizational structure must keep pace. Achieving world class status is not enough. The new hallmark of excellence must be continuous improvement to maintain a superior position. The plans and suggestions outlined in *Reinventing The Factory* allow the entrepreneur the responsibility and authority to effect ongoing improvements and render processes adaptable to reflect additions or removals of product lines, changes in sales volume over time and modifications resulting from previous or concurrent improvements. Harmon and Peterson provide the valuable tools and methods necessary to attain such goals. They highlight the dynamic nature of progress itself and show how managers can overcome the most tenacious habit, the resistance to change.

Balanced Automation Systems Luis M. Camarinha-Matos, Hamideh Afsarmanesh, 2013-06-05 Towards Balanced Automation The concept Manufacturing industries worldwide are facing tough challenges as a consequence of the globalization of economy and the openness of the markets Progress of the economic blocks such as the European Union NAFTA and MERCOSUR and the global agreements such as GATT in addition to their obvious economic and social consequences provoke strong paradigm shifts in the way that the manufacturing systems are conceived and operate To increase profitability and reduce the manufacturing costs there is a recent tendency towards establishing partnership links among the involved industries usually between big industries and the networks of components suppliers To benefit from the advances in technology similar agreements are being established between industries and

universities and research institutes Such an open tete cooperation network may be identified as an extended enterprise or a virtual enterprise In fact the manufacturing process is no more carried out by a single enterprise rather each enterprise is just a node that adds some value a step in the manufacturing chain to the cooperation network of enterprises The new trends create new scenarios and technological challenges especially to the Small and Medium size Enterprises SMEs that clearly comprise the overwhelming majority of manufacturing enterprises worldwide Under the classical scenarios these SMEs would have had big difficulties to access or benefit from the state of the art technology due to their limited human financial and material resources
