Osipov, FOREIGN TECHNOLOGY DIV WRIGHT-PATTERSON AFB OHIO., 1967 The present state of experimental and theoretical investigations of relaxation processes taking place in shock waves in gases and air is described and analyzed Particular attention is paid to physical aspects of relaxation phenomena and to elucidation of patterns in processes taking place in the establishment of statistical equilibrium with respect to various degrees of freedom The first chapter deals with general problems and presents a qualitative description of the relaxation process and the fundamentals of experimental methods The second deals with shock tubes as a means for generating and studying strong shock waves and related phenomena Chapter three deals with the experimental methods used for investigating nonequilibrium phenomena taking place in shock waves Chapter four is devoted to a theoretical analysis of relaxation processes and available experimental data Chapter five deals with nonequilibrium phenomena taking place behind a shock front in air Chapter six briefly outlines the gas flow properties in relaxation and contains a brief analysis of gaskinetic methods for deriving equations of equilibrium and relaxation hydrodynamics and methods of the thermodynamics of irreversible processes Author *A Relaxation Treatment of Shock Waves* Leslie Colin Woods, 1950 **A Relaxation Treatment of Shock Waves** Leslie Colin WOODS, 1953 *A Relaxation Treatment of Shock Waves* Leslie Colin WOODS, 1953 **A Relaxation Treatment of Shock Waves**, 1953 Theoretical and Experimental Study of Vibrational Relaxation in Shock Waves P A Blythe, 1961 *Shock Waves in a Relaxation Medium* S. Method for Calculating Effects of Dissociation on Flow Variables in the Relaxation Zone Behind Normal Shock Waves John S. Evans, 1956 Because the chemical reaction rates needed to predict the dependence of degree of dissociation on distance behind the shock are not known order of magnitude estimates of their values have been used in a numerical example the purpose of which is to illustrate the use of reaction rate equations to predict relaxation time and distance behind the shock front Handbook of Shock Waves, Three Volume Set Gabi Ben-Dor, Ozer Igra, Tov Elperin, 2000-10-18 The Handbook of Shock Waves contains a comprehensive structured coverage of research topics related to shock wave phenomena including shock waves in gases liquids solids and space Shock waves represent an extremely important physical phenomena which appears to be of special practical importance in three major fields compressible flow aerodynamics materials science and astrophysics Shock waves comprise a phenomenon that occurs when pressure builds to force a

reaction i.e. sonic boom that occurs when a jet breaks the speed of sound This Handbook contains experimental theoretical and numerical results which never before appeared under one cover the first handbook of its kind The Handbook of Shock Waves is intended for researchers and engineers active in shock wave related fields Additionally R D establishments applied science research laboratories and scientific and engineering libraries both in universities and government institutions As well as undergraduate and graduate students in fluid mechanics gas dynamics and physics Key Features Ben Dor is known as one of the founders of the field of shock waves Covers a broad spectrum of shock wave research topics Provides a comprehensive description of various shock wave related subjects First handbook ever to include under one separate cover experimental theoretical and numerical results

Shock Wave Reflection Phenomena Gabi Ben-Dor, 2007-08-28 This book is a comprehensive state of the knowledge summation of shock wave reflection phenomena from a phenomenological point of view It includes a thorough introduction to oblique shock wave reflections dealing with both regular and Mach types It also covers in detail the corresponding two and three shock theories The book moves on to describe reflection phenomena in a variety of flow types as well as providing the resolution of the Neumann paradox *Advances in the Theory of Shock Waves* Heinrich Freistühler, Anders Szepessy, 2012-12-06 In the field known as the mathematical theory of shock waves very exciting and unexpected developments have occurred in the last few years Joel Smoller and Blake Temple have established classes of shock wave solutions to the Einstein Euler equations of general relativity indeed the mathematical and physical consequences of these examples constitute a whole new area of research The stability theory of viscous shock waves has received a new geometric perspective due to the work of Kevin Zumbrun and collaborators which offers a spectral approach to systems Due to the intersection of point and essential spectrum such an approach had for a long time seemed out of reach The stability problem for in viscous shock waves has been given a novel clear and concise treatment by Guy Metivier and coworkers through the use of paradifferential calculus The L^1 semi group theory for systems of conservation laws itself still a recent development has been considerably condensed by the introduction of new distance functionals through Tai Ping Liu and collaborators these functionals compare solutions to different data by direct reference to their wave structure The fundamental properties of systems with relaxation have found a systematic description through the papers of Wen An Yong for shock waves this means a first general theorem on the existence of corresponding profiles The five articles of this book reflect the above developments

Departures from the Linear Equation for Vibrational Relaxation in Shock Waves in Oxygen and Carbon Dioxide H. K. Zienkiewicz, 1963 [A Technique for Determining Relaxation Times by Free-flight Tests of Low-fineness-ratio Cones; with Experimental Results for Air at Equilibrium Temperatures Up to 3440 K](#) Jack D. Stephenson, 1960 This report describes a technique which combines theory and experiments for determining relaxation times in gases The technique is based on the measurement of shapes of the bow shock waves of low fineness ratio cones fired from high velocity guns The theory presented in the report provides a means by which shadowgraph data showing the bow waves

can be analyzed so as to furnish effective relaxation times Relaxation times in air were obtained by this technique and the results have been compared with values estimated from shock tube measurements in pure oxygen and nitrogen The tests were made at velocities ranging from 4600 to 12 000 feet per second corresponding to equilibrium temperatures from 35900 R 19900 K to 6200 R 34400 K under which conditions at all but the highest temperatures the effective relaxation times were determined primarily by the relaxation time for oxygen and nitrogen vibrations On relaxation effects in shock waves in gases P.
