Hentschel, 2019-06-12 The papers published in these proceedings represent the latest developments in the nondestructive characterization of materials and were presented at the Eleventh International Symposium on Nondestructive Characterization of Materials held in June 24-28 2002 in Berlin Germany *Nondestructive Characterization of Materials VIII* Robert E. Green, 2012-12-06 Different physical models for the Snoek type relaxation in ternary systems Fe-C-Me are analyzed from the viewpoint of a distance of interatomic interaction taken into account For non-saturated from the viewpoint of overlapping of interatomic interaction in bcc alloys the physically sufficient and optimal for the computer simulation is the short range model which takes into account the interatomic interaction and the average amount of substitutional atoms in the first coordination shell

only For high alloyed bcc systems i.e. with the overlapped interatomic interaction the carbon atom undergoes an interaction of a few substitutional atoms simultaneously That leads to the appearance of one broadened Snoek peak Activation energy of such a peak is summed from the elastic and chemical interatomic interactions Experimental results for alloys with bcc solid solution structure and its computer simulations allow to introduce the new criterion for the high alloy state of monophasic steels the high alloyed state corresponds to the situation when substitutional atoms can not be considered any longer as the isolated atoms From the viewpoint of mechanical spectroscopy this situation corresponds to the appearance of one broadened IF Snoek type peak instead of two peaks existed for the steels with lower substitutional atom concentration
