Hydrosystems Engineering Uncertainty Analysis Yeou-Koung Tung, Ben-Chie Yen, 2005-04-14 Failure of hydrosystems such as dams levees storm sewers or pollution control systems pose threats to the public safety and health as well as potentially inflict enormous damages on properties and environments Many failures of hydrosystems are mainly attributed by the existence of various uncertainties including inherent natural randomness and the lack of complete understanding of involved geophysical processes It is therefore essential to

systematically quantify the degree of uncertainty for the problem in hand so that reliability assessment and risk based design of hydrosystems can be made The conventional approach of frequency analysis of heavy rainfalls or large floods consider only portion of the uncertainties involved in hydrosystem engineering problems Over the past two decades or so there has been a steady growth on the development and application of uncertainty analysis techniques in hydrosystems engineering and other disciplines The aim of this book is to bring together these uncertainty analysis techniques in one book and to demonstrate their applications and limitations for a wide variety of hydrosystem engineering problems **Flood Issues in**

Contemporary Water Management J. Marsalek,W. Ed Watt,Evzen Zeman,Friedhelm Sieker,2012-12-06 In 1997 disastrous flooding running through the Czech Republic Poland Germany took the lives of a great number of people and caused economic damage estimated in tens of billions of dollars Flooding of the Yangtze river in 1998 killed more than 3000 people dislocated 230 million souls and caused direct damage of more than 45 billion Both the general public and the experts are asking what we can learn from these recent events to reduce loss of life and flood damage The 1997 floods were dealt with by experts from the Czech Republic Poland and Germany who presented timely reports on combatting floods both success stories and shortcomings This experience is further extended by reports from experts drawn from 13 other countries developing a broad overview of flood risk management covering the ecosystem approach to flood management including socioeconomic issues flood impacts on water quality human health and natural ecosystems **Geotechnical Safety and**

Application of Frequency and Risk in Water Resources V.P. Singh, 2012-12-06 Floods constitute a persistent and serious problem throughout the United States and many other parts of the world They are responsible for losses amounting to billions of dollars and scores of deaths annually Virtually all parts of the nation coastal mountainous and rural are affected by them Two aspects of the problem of flooding that have long been topics of scientific inquiry are flood frequency and risk analyses Many new even improved techniques have recently been developed for performing these analyses Nevertheless actual experience points out that the frequency of say a 100 year flood in lieu of being encountered on the average once in one hundred years may be as little as once in 25 years It is therefore appropriate to pause and ask where we are where we are going and where we ought to be going with regard to the technology of flood frequency and risk analyses One way to address these questions is to provide a forum where people from all quarters of the world can assemble discuss and share their experience and expertise pertaining to flood frequency and risk analyses This is what constituted the motivation for organizing the International Symposium on Flood Frequency and Risk Analyses held May 14-17 1986 at Louisiana State University Baton Rouge Louisiana

Biomimetic Membranes for Sensor and Separation Applications Claus Hélix-Nielsen,2012-01-02 This book addresses the possibilities and challenges in mimicking biological membranes and creating membrane based sensor and separation devices Recent advances in developing biomimetic

membranes for technological applications will be presented with focus on the use of integral membrane protein mediated transport for sensing and separation. It describes the fundamentals of biosensing as well as separation and shows how the two processes are working in a cooperative manner in biological systems. Biomimetics is a truly cross disciplinary approach and this is exemplified using the process of forward osmosis. It will be presented as an illustration of how advances in membrane technology may be directly stimulated by an increased understanding of biological membrane transport. In the development of a biomimetic sensor separation technology both channels ion and water channels and carriers transporters are important. An ideal sensor separation device requires the supporting biomimetic matrix to be virtually impermeable to anything but the solute in question. In practice however a biomimetic support matrix will generally have finite permeabilities to water electrolytes and non electrolytes. These non protein mediated membrane transport contributions will be presented and the implications for biomimetic device construction will be discussed. New developments in our understanding of the reciprocal coupling between the material properties of the biomimetic matrix and the embedded proteins will be presented and strategies for inducing biomimetic matrix stability will be discussed. Once reconstituted in its final host biomimetic matrix the protein stability also needs to be maintained and controlled. Beta barrel proteins exemplified by the E Coli outer membrane channels or small peptides are inherently more stable than alpha helical bundle proteins which may require additional stabilizing modifications. The challenges associated with insertion and stabilization of alpha helical bundle proteins including many carriers and ligand and voltage gated ion and water channels will be discussed and exemplified using the aquaporin protein. Many biomimetic membrane applications require that the final device can be used in the macroscopic realm. Thus a biomimetic separation device must have the ability to process hundred of liters of permeate in hours effectively demanding square meter size membranes. Scalability is a general issue for all nano inspired technology developments and will be addressed here in the context biomimetic membrane array fabrication. Finally a robust working biomimetic device based on membrane transport must be encapsulated and protected yet allowing massive transport through the encapsulation material. This challenge will be discussed using microfluidic design strategies as examples of how to use microfluidic systems to create and encapsulate biomimetic membranes. The book provides an overview of what is known in the field where additional research is needed and where the field is heading.
