Rings With Minimum Condition:

Rings with Minimum Condition Emil Artin, Cecil James Nesbitt, Robert McDowell Thrall, 1952 Structure of Rings Nathan Jacobson, 1964 The main purpose of this volume is to give an account of the important developments in the theory of non commutative rings These are the structure theory of rings without finiteness assumptions cohomology of algebras and structure and representation theory of non semi simple rings Frobenius algebras quasi Frobenius rings **Rings with Minimum Condition** Emil Artin, 1955 **Rings with Minimum Condition** Emil Artin, Cecil J. Nesbitt, Robert M. Thrall, 1948 *Rings with Minimum Condition* , 1946 *Rings and Homology* James P. Jans, 2015-01-05 This concise text is geared toward students of mathematics who have completed a basic college course in algebra Combining material on ring structure and homological algebra the treatment offers advanced undergraduate and graduate students practice in the techniques of both areas After a brief review of basic concepts the text proceeds to an examination of ring structure with particular attention to the structure of semisimple rings with minimum condition Subsequent chapters develop certain elementary homological theories introducing the functor Ext and exploring the various projective dimensions global dimension and duality theory Each chapter concludes with a set of exercises **Topological Rings Satisfying Compactness Conditions** M. Ursul, 2012-12-06 Introduction In the last few years a few monographs dedicated to the theory of topological rings have appeared Warn²⁷ Warn²⁶ Wies¹⁹ Wies²⁰ ArnGM Ring theory can be viewed as a particular case of Z algebras Many general results true for rings can be extended to algebras over commutative rings In topological algebra the structure theory for two classes of topological algebras is well developed Banach algebras and locally compact rings The theory of Banach algebras uses results of Banach spaces and the theory of locally compact rings uses the theory of LCA groups As far as the author knows the first papers on the theory of locally compact rings were Pontr¹ J¹ J² J^T An¹ O^t K¹ K² K³ K⁴ K⁵ K⁶ Later two papers GS¹ GS² appeared which contain many results concerning locally compact rings This book can be used in two ways It contains all necessary elementary results from the theory of topological groups and rings In order to read these parts of the book the reader needs to know only elementary facts from the theories of groups rings modules topology The book consists of two parts **Injective Modules and Injective Quotient Rings** Carl Faith, 2019-08-21 First published in 1982 These lectures are in two parts Part I entitled injective Modules Over Levitzki Rings studies an injective module E and chain conditions on the set $A \subseteq E \subseteq R$ of right ideals annihilated by subsets of E Part II is on the subject of FPF or finitely pseudo Frobenius rings i.e. all finitely generated faithful modules generate the category $\text{mod } R$ of all R modules The FPF rings had been introduced by Azumaya as a generalization of quasi Frobenius rings but FPF includes infinite products of Prufer domains e.g. Z w **Cyclic Modules and the Structure of Rings** S.K. Jain, Ashish K. Srivastava, Askar A. Tuganbaev, 2012-09-27 This unique monograph brings together important material in the field of noncommutative rings and modules It provides an up to date account of the topic of cyclic modules and the structure of rings which will be of particular

interest to those working in abstract algebra and to graduate students who are exploring potential research topics A First Course in Noncommutative Rings T.Y. Lam, 2012-12-06 One of my favorite graduate courses at Berkeley is Math 251 a one semester course in ring theory offered to second year level graduate students I taught this course in the Fall of 1983 and more recently in the Spring of 1990 both times focusing on the theory of noncommutative rings This book is an outgrowth of my lectures in these two courses and is intended for use by instructors and graduate students in a similar one semester course in basic ring theory Ring theory is a subject of central importance in algebra Historically some of the major discoveries in ring theory have helped shape the course of development of modern abstract algebra Today ring theory is a fertile meeting ground for group theory group rings representation theory modules functional analysis operator algebras Lie theory enveloping algebras algebraic geometry finitely generated algebras differential operators invariant theory arithmetic orders Brauer groups universal algebra varieties of rings and homological algebra cohomology of rings projective modules Grothendieck and higher K groups In view of these basic connections between ring theory and other branches of mathematics it is perhaps no exaggeration to say that a course in ring theory is an indispensable part of the education for any fledgling algebraist The purpose of my lectures was to give a general introduction to the theory of rings building on what the students have learned from a standard first year graduate course in abstract algebra *Representation Theory of Finite Groups and Associative Algebras* Charles W. Curtis, Irving Reiner, 2006 Provides an introduction to various aspects of the representation theory of finite groups This book covers such topics as general non commutative algebras Frobenius algebras representations over non algebraically closed fields and fields of non zero characteristic and integral representations Groups, Rings And Modules With Applications M.R. Adhikari, A. Adhikari, 2003 **Abelian Groups** L. Fuchs, 2014-07-15 Abelian Groups deals with the theory of abelian or commutative groups with special emphasis on results concerning structure problems More than 500 exercises of varying degrees of difficulty with and without hints are included Some of the exercises illuminate the theorems cited in the text by providing alternative developments proofs or counterexamples of generalizations Comprised of 16 chapters this volume begins with an overview of the basic facts on group theory such as factor group or homomorphism The discussion then turns to direct sums of cyclic groups divisible groups and direct summands and pure subgroups as well as Kulikov's basic subgroups Subsequent chapters focus on the structure theory of the three main classes of abelian groups the primary groups the torsion free groups and the mixed groups Applications of the theory are also considered along with other topics such as homomorphism groups and endomorphism rings the Schreier extension theory with a discussion of the group of extensions and the structure of the tensor product In addition the book examines the theory of the additive group of rings and the multiplicative group of fields along with Baer's theory of the lattice of subgroups This book is intended for young research workers and students who intend to familiarize themselves with abelian groups **Introduction to Algebra** R. Kochendorffer, 2012-12-06 This book is intended as a textbook for an undergraduate course on algebra In most

universities a detailed study of abstract algebraic systems commences in the second year By this time the student has gained some experience in mathematical reasoning so that a too elementary book would rob him of the joy and the stimulus of using his ability I tried to make allowance for this when I chose the level of presentation On the other hand I hope that I also avoided discouraging the reader by demands which are beyond his strength So the first chapters will certainly not require more mathematical maturity than can reasonably be expected after the first year at the university Apart from one exception the formal prerequisites do not exceed the syllabus of an average high school As to the exception I assume that the reader is familiar with the rudiments of linear algebra i e addition and multiplication of matrices and the main properties of determinants In view of the readers for whom the book is designed I felt entitled to this assumption In the first chapters matrices will almost exclusively occur in examples and exercises providing non trivial instances in the theory of groups and rings In Chapters 9 and 10 only vector spaces and their properties will form a relevant part of the text A reader who is not familiar with these concepts will have no difficulties in acquiring these prerequisites by any elementary textbook e g 10

Algebra II Ring Theory Carl Faith, 2012-12-06 **Semidistributive Modules and Rings** A.A. Tuganbaev, 2012-12-06 A module M is called distributive if the lattice $\text{Lat } M$ of all its submodules is distributive i e $F \cap (G + H) = (F \cap G) + (F \cap H)$ for all submodules F, G and H of the module M A module M is called uniserial if all its submodules are comparable with respect to inclusion i e the lattice $\text{Lat } M$ is a chain Any direct sum of distributive resp uniserial modules is called a semidistributive resp serial module The class of distributive resp semidistributive modules properly contains the class of all uniserial resp serial modules In particular all simple resp semisimple modules are distributive resp semidistributive All strongly regular rings for example all factor rings of direct products of division rings and all commutative regular rings are distributive all valuation rings in division rings and all commutative Dedekind rings e g rings of integral algebraic numbers or commutative principal ideal rings are distributive A module is called a Bezout module or a locally cyclic module if every finitely generated submodule is cyclic If all maximal right ideals of a ring A are ideals e g if A is commutative then all Bezout A modules are distributive

Near-Rings and Near-Fields Yuen Fong, Howard E. Bell, Wen-Fong Ke, Gordon Mason, G.F. Pilz, 2012-12-06 Near Rings and Near Fields opens with three invited lectures on different aspects of the history of near ring theory These are followed by 26 papers reflecting the diversity of the subject in regard to geometry topological groups automata coding theory and probability as well as the purely algebraic structure theory of near rings Audience Graduate students of mathematics and algebraists interested in near ring theory *Algebras, Rings and Modules* Michiel Hazewinkel, Nadiya Gubareni, V.V. Kirichenko, 2006-01-18 Associative rings and algebras are very interesting algebraic structures In a strict sense the theory of algebras in particular noncommutative algebras originated from a single example namely the quaternions created by Sir William R Hamilton in 1843 This was the first example of a noncommutative numbers system During the next forty years mathematicians introduced other examples of noncommutative algebras began to bring some order into them

and to single out certain types of algebras for special attention. Thus low dimensional algebras, division algebras and commutative algebras were classified and characterized. The first complete results in the structure theory of associative algebras over the real and complex fields were obtained by T. Molien, E. Cartan and G. Frobenius. Modern ring theory began when J. H. Wedderburn proved his celebrated classification theorem for finite dimensional semisimple algebras over arbitrary fields. Twenty years later E. Artin proved a structure theorem for rings satisfying both the ascending and descending chain condition which generalized Wedderburn's structure theorem. The Wedderburn-Artin theorem has since become a cornerstone of noncommutative ring theory. The purpose of this book is to introduce the subject of the structure theory of associative rings. This book is addressed to a reader who wishes to learn this topic from the beginning to research level. We have tried to write a self-contained book which is intended to be a modern textbook on the structure theory of associative rings and related structures and will be accessible for independent study. **Equational Compactness in Rings** D.
