Chatel, F. Darcel, J. Pecker, 2012-12-06 The International

Meeting on Brain Oncology in Rennes was organised in honor of Jean Pecker to pay tribute to his contribution to the development of neurological sciences and to take stock of the current state of knowledge on brain tumors a domain in which the role of neurosurgery has been and will continue to be primordial During the two day conference the major themes of brain oncology studies both fundamental and clinical were examined oncogenesis tumoral markers and immunology metabolic and diagnosis imaging prognostic factors and therapeutic strategies The large number and high quality of participations resulted in a genuinely synthetic view of current advances in research of which this book presents the essentials We have attempted both to preserve the richness of scientific exchanges which occurred and to publish a great many oral and poster communications The book respects the organization of conference sessions and thus reflects the importance accorded to glial tumor studies This may seem disproportionate given their frequency of occurrence in proportion to total numbers of intracranial tumor processes but their gravity and quasi total resistance to current therapeutic methods are ample justification Moreover this is the domain in which hopes of progress are beginning to appear and it is becoming possible to envisage treatment based on recently established fundamental knowledge Organ Directed Toxicities of Anticancer Drugs Miles P. Hacker, John S. Lazo, Thomas R. Tritton, 2012-12-06 The addition of chemotherapy as an effective means to treat cancer has had a major impact on selected human malignancies Due to a general inability to differentiate between normal and neoplastic cells little selectivity exists in currently used oncolytic drugs Consequently significant toxicity to the patient is expected when systemic cancer chemotherapy is chosen as an appropriate therapeutic intervention Much of this toxicity such as damage to the bone marrow gastrointestinal tract or hair follicles is predictable based upon the fact that anticancer drugs kill actively dividing cells These types of toxicities while serious are usually manageable and reversible and are therefore not often considered to be dose limiting Unfortunately several of the most important anticancer drugs also damage tissues in which the growth fraction is relatively small Such toxicities can not be predicted based on the chemical structure of the drugs are often not detected in preclinical studies and are encountered frequently for the first time in clinical

studies Further unlike most of the proliferative dependent toxicities the unpredicted toxicities are usually irreversible or only partially reversible upon cessation of drug administration Because of this the unpredicted toxicities are referred to as dose limiting They represent a significant barrier to the ultimate efficacy of several of our most important anticancer drugs

New Frontiers in Mammary Pathology 1986 K.H. Hollmann,R. Fundamental Problems in Breast Cancer Alexander H.G. Paterson,Alan W. Lees,2012-12-06 The chapters in this book are those presented at the Second International Symposium on Fundamental Problems in Breast Cancer held at Banff Alberta April 26 29 1986 This is therefore the second volume in the series of symposia held in the Canadian Rockies The aim of these symposia is to provide a supportive atmosphere for the development of new concepts as well as for the presentation of high quality scientific data This is reflected in the chapters presented here Many of the chapters put forward new hypotheses which will be tested in the clinic or laboratory in the next few years In choosing the subjects for discourse we preferred to tackle areas where controversy existed and in this book we have grouped the chapters around discussion themes The relative merits of mammography and physical examination in the detection of small lesions within the breast and the natural history of these lesions were important topics at the symposium and the results of early detection studies will have a major effect on health care costs We have devoted a large section of this book to this subject The mechanism of growth and response of endocrine sensitive tumors and current concepts of the statistics and cost benefit assessment of adjuvant chemotherapy trials comprise two other sections of the book where original and stimulating ideas were presented

Biochemical Modulation of Anticancer Agents: Experimental and Clinical Approaches Frederick A. Valeriote,L.O.

Baker,2012-12-06 Biochemical Modulation at the present time defines an area of study in which the intracellular metabolism of a given anti cancer agent is modulated usually by a noncytotoxic agent or a cytotoxic agent at sufficiently low dosage to make it non cytotoxic in order to either increase the effectiveness of the particular agent against tumor cells or decrease its cytotoxicity against normal cells The major focus of modulation has been the agents 5 fluorouracil FUra arabinofuranosylcytosine ara C methotrexate MTX and a few alkylating agents The major thrust of the studies has been to increase the flow of the anticancer agent along the pathway responsible for the formation of the cytotoxic species for example FUra to FUTP or ara C to ara CTP While in most cases the application of research results to clinical trials does not require the subsequent expertise of the laboratory researchers application of biochemical modulatory schemes to clinical protocols necessitate a dramatic break with the past procedures As shown in the laboratory clinical loop below close collaboration between the laboratory and clinical investigator is essential While the laboratory REDEFINE TECHNOLOGY TESTS OR QUESTIONS FOR FURTHER THERAPEUTIC ADVANCE CLINICAL EXPERIMENTAL PROTOCOL LABORATORY RESEARCH STUDIES DEFINE AND TEST APPROPRIATE SCIENTIFIC PARAMETERS results define rationally based regimens it is essential that the clinical protocols contain the requirement that clinical material either tumor or normal tissues be sampled to determine whether the biochemical modulation being proposed is in fact being accomplished

Recent Concepts in Sarcoma Treatment J.R. Ryan,L.O. Baker,1988-05-31 There have been significant advances in the treatment of sarcomas in the past several years Further different clinical treatment programs are being advocated in different areas including surgery alone surgery with preoperative or post operative chemotherapy surgery with different radiotherapy modalities with each investigator espousing his own treatment program On the other side there is the question of whether these treatment programs are offering better results or whether the natural history of sarcomas has changed The International Symposium on Sarcomas was held at Innisbrook Resort Tarpon Springs Florida October 8 10 1987 This was the first international symposium to date involving all of the disciplines treating sarcomas including pathologists orthopaedic surgeons general surgeons medical oncologists pediatric oncologists and radiation oncologists The Symposium brought together a number of specialists working in the clinical field of sarcomas for a presentation of their specific treatment programs and their results The presentations were followed by panel discussions to stimulate educational debate as to the different forms of treatment for sarcomas and to formulate some conformity in control of disease control of spread and ultimate function for the patient James R Ryan M D

Breast Cancer: Origins, Detection, and Treatment Marvin A. Rich,Jean Carol Hager,Joyce Taylor-Papadimitriou,2012-12-06 The control of breast cancer a leading cause of cancer death in women will depend ultimately on our understanding of the disease its origin and progression which in turn will permit the effective management of its treatment its detection and perhaps even its prevention It is for a better understanding of this spectrum of biological processes crossing back and forth across scientific and clinical disciplines that this volume strives

Several broad topics have been addressed in organizing a large mass of work representing state of the art updates from many of the major breast cancer research groups around the world. The chapters in the first section speak to the factors affecting the growth and development of normal and malignant mammary epithelium. Special emphasis is placed on insights drawn from developmental biology, the cellular interactions that occur in the mammary gland during growth and differentiation, and the study of hormones and growth factors in the regulation of growth and differentiation of normal and malignant breast tissues. In the section on the biology of breast cancer, there is a characterization of relevant model systems for the study of breast cancer and their contribution to our understanding of preneoplasia and progression in mammary cancer. Included as well is the current status of major studies on the immunological aspects of breast cancer and the latest efforts in the development of markers for metastasis in breast cancer.

Breast Cancer: Scientific and Clinical Progress

Marvin A. Rich, Jean Carol Hager, Diana M. Lopez, 2012-12-06. Effective control of breast cancer depends on three types of research accomplishment: understanding the disease's origins and progression; successfully applying this knowledge to methods of detection, diagnosis, and treatment; and finding ways to make these advances truly available to the public as effectively as possible. The significant progress that is occurring across this entire spectrum of pioneering investigation is reflected in these proceedings of the 1987 biennial conference of the International Association for Breast Cancer Research. The first section of the book focuses on oncogenes and chemical effectors that may play key roles in early cell transformation leading to breast cancer. Research discussed includes identification of specific oncogenes which appear to be involved in the disease; study of their activation and expression; examination of the biological effects of various growth factors isolated from breast cancer cell lines; and investigation of the molecular mechanisms by which estrogens promote and stimulate growth of breast cancers. The second group of chapters deals with several other complex factors and phenomena which may influence tumor formation in the breast, for example, expression of abnormalities by fibroblasts, disruption of epithelial-mesenchymal interactions, and loss of ability to synthesize normal basal lamina, resulting in alterations in the extracellular matrix. Clarification of the processes of normal mammary gland development and differentiation is central to much of this work.

Application of Monoclonal Antibodies in Tumor Pathology Dirk J. Ruiter, G.J. Fleuren, S.O. Warnaar, 2012-12-06. The development of monoclonal antibodies to human tumor-associated antigens has greatly facilitated the application of immunohistochemical techniques to analyze surgically removed tissues. During the last few years, this approach has been utilized by a progressively increasing number of investigators to analyze malignant cells. Although monoclonal antibodies to tumor-associated antigens have not become yet routine reagents in immunopathology, they have provided new information which could not be obtained with conventional antisera or histochemical procedures. The following are representative examples. Tumor-associated antigens have been identified which display a restricted distribution in normal tissues and therefore may represent useful markers for radio imaging and appropriate targets for immunotherapy. In spite of undetected

table differences with conventional histopathological approaches heterogeneity has been found in the antigenic profile of tumor cells within a lesion in autologous lesions removed from different anatomic sites from a given patient and in lesions removed from different patients Phenotypes of tumor cells have been identified which correlate with the biology of tumor cells and with the clinical course of the disease From a practical view point the use of monoclonal antibodies in immunopathology has enhanced interactions between pathologists and immunologists as exemplified by the present book Such interactions have contributed to the application of basic research to clinical problems The chapter of this book discusses investigations performed with monoclonal antibodies to antigens expressed by various types of normal and malignant human cells

Women at High Risk to Breast Cancer B.A. Stoll, 2012-12-06 A reprint of the 1989 edition of this book has been made necessary by continuing demand after rapid exhaustion of the first printing In the two years since its appearance there has been relatively little expansion of knowledge on this topic and its massive accumulation of references still remains an authoritative guide in the difficult task of developing a national breast cancer prevention model At the same time its thesis has been sharpened by the publication of a companion volume *Approaches to Breast Cancer Prevention* Kluwer 1991 similarly edited byrne Breast cancer is on the increase throughout the Western world where it is a major source of anxiety among women The disease is also becoming more frequent in Asian and South American countries where once it was relatively uncommon Multiple factors are suspected of promoting the disease and the increasing risk is attributed to recent changes in life style and diet This book is intended to provide an authoritative and balanced survey of the latest research into the genetic familial hormonal reproductive nutritional social and geographic factors known to be associated with an increased predisposition to the disease

Genetics of Colorectal Cancer for Clinical Practice Fred H. Menko, 1993-07-31 Colorectal cancer is a collective term for a heterogeneous group of diseases In a large proportion of cases the condition is attributable to genetic predisposition Those directly involved in the treatment of patients with cancer of the large bowel are confronted to an increasing degree with the genetic aspects of the disease In familial and hereditary forms of the disorder periodic screening of the close relatives of the patients can in principle prevent disease and death from colorectal cancer Presymptomatic diagnosis by means of DNA technology is now possible in many cases of familial adenomatous polyposis Genetic diagnosis will be increasingly important for the identification of high risk groups This book summarizes those aspects of the genetics of colorectal cancer that are important for clinical practice It has been stated that clinicians can contribute to the goal of reducing mortality from cancer by asking each patient about his or her family history of cancer The aim of this book is to provide a guideline for the management of those situations in which the family history of colorectal cancer is found to be positive
