Renewable Energy In The Uk:

Renewable Energy in the UK David Elliott, 2019-01-08 This book offers a detailed account of how renewable energy has moved from the margins to the mainstream in the UK and of the battles that have been fought to achieve this trawling through the often troubled history of government involvement The book examines how renewables became what now seem likely to be the dominant energy sources of the future Renewable energy technologies using solar and wind power and other natural energy sources are now supplying around 30% of UK electricity and appear set to continue expanding to supply around 50% within the next decade Although the emphasis of the book is on the UK developments there are compared with those in other countries to provide an overall assessment of the relevance of the UK experience Chapters explore why the UK still lags behind many other countries in deploying renewables in part it is argued due to its continued reliance on nuclear power The book ends with a discussion on what sort of changes may be expected over the coming years The author does not assume a single answer but invites readers to consider the possibilities **Renewable Energy** Pauline Marstrand, 1990

Department of Energy and Climate Change, 2009 This document sets out the Government's plans for a radical increase in the UK's use of renewable electricity heat and transport which will meet the legally binding target of 15 per cent of energy coming from renewable sources by 2020 This Strategy will help tackle climate change reducing the UK's emissions of carbon dioxide by over 750 million tonnes between now and 2030 It will also promote the security of UK energy supply reducing our overall fossil fuel demand by around 10 per cent and gas imports by 20-30 per cent against what they would have been in 2020 And it will provide opportunities for the UK economy with the potential to create up to half a million more jobs in the UK renewable energy sector resulting from around 100 billion of new investment In parallel with energy saving nuclear and carbon capture and storage this is a key element for setting the UK on the path to achieve a low carbon sustainable future that helps address dangerous climate change This strategy could result in more than 30 per cent of electricity and 12 per cent of heat generated from renewables and 10 per cent of transport energy from renewables The Government will provide financial support for renewable electricity and heat worth around 30 billion between now and 2020 drive delivery and clear away barriers through the Office for Renewable Energy Deployment increase investment in emerging technologies and pursue new sources of supply create new opportunities for individuals communities and business to harness renewable energy The UK Low Carbon Transition Plan is published alongside this document ISBN

Switching to Renewable Power Volkmar Lauber, 2012-05-16 Renewable energy has enjoyed relatively good and sometimes extraordinary growth in recent years in particular photovoltaics and wind but it will be difficult to sustain such rates of diffusion on a global basis A more complete transition to renewable energy is required on a demanding timescale set by climate change and fossil fuel depletion This book analyses strategies for promoting renewable energy within the context of a rapid energy transition using case studies from different countries over the past 30 years Having described the global context in detail covering oil and gas depletion climate change third world development and the potential for renewable energy the authors evaluate support mechanisms at national and international levels offering readers a clear understanding of the regulatory framework and an opportunity to promote renewable energy effectively This book offers energy policy makers renewable energy professionals energy consultants and students a platform for development and an invaluable research text Contributing authors include Jorg Schindler and Werner Zittel Ludwig Bohlkow Systemtechnik Germany Ian Rowlands University of Waterloo Canada Giulio Volpi WWF Europe Kristian Hvitfelt Nielsen Aarhus University Denmark Staffan Jacobsson Chalmers University of Technology Sweden Peter Connor University of Warwick UK Ole Langniss Centre of Solar Energy and Hydrogen Research in Baden Wurttemberg Germany Ryan Wiser Lawrence Berkeley National Laboratory US David Elliott The Open University UK and Frede Hvelplund Aalborg University Denmark **Renewable Energy in Europe** European Renewable Energy Council (EREC), 2010 How can the European Union meet its binding 20% renewable energy target in final energy consumption by the year 2020 Which sources offer the best prospects for realizing this goal These are the questions answered by this key book which analyses the current situation of renewable energy in Europe examines the latest technological financial and economic developments and outlines ways in which the renewable energy market can be developed The book is divided into sections examining the integration of renewable energy electricity heating and cooling as well as biofuels All the main technologies are covered with exploration of benefits and applications costs and prices markets and installed capacity policy instruments key countries and success stories and targets and long term potential This will be essential reading for policy decision makers at all levels and to all those involved in the development of the renewable energy industry Publisher's description The Political Economy of Clean Energy Transitions Douglas Arent, Channing Arndt, Mackay Miller, Finn Tarp, Owen Zinaman, 2017 A volume on the political economy of clean energy transition in developed and developing regions with a focus on the issues that different countries face as they transition from fossil fuels to lower carbon technologies *Sixteenth European Photovoltaic Solar Energy Conference* H. Renewable Energy in the UK Great Britain. Department of Energy, 1988 **Fundamentals and Source Characteristics of Renewable Energy Systems** Radian Belu, 2019-09-10 This textbook is intended for an audience with little or no power engineering or renewable energy background. The book covers electric energy from alternative energy sources including solar, wind, water, hydropower, geothermal and ocean energy. Core issues discussed include wind and solar resource estimates and analysis, solar thermal systems, solar collectors, photovoltaics, wind turbines, geothermal energy, energy storage, small hydropower, wave, tide and ocean energy and characteristics of energy conversion, control and electrical aspects. This is one of the most comprehensive textbooks for students, engineers and professionals who study renewable energy. There are several questions and problems presented with increasing difficulty, most of which focus on practical applications. The materials and problems are drawn from the author's extensive experience in renewable energy analysis, assessment, design, control and the power electronics of wind and solar energy conversion systems. Each section of the book contains several solved examples as well as practical and advanced discussions that instill critical thinking and apply to industrial applications. The book is divided into eight chapters and covers the most important aspects of renewable energy sources and technologies.

Harnessing Renewable Energy in Electric Power Systems Boaz Moselle, Jorge Padilla, Richard Schmalensee, 2010-09-23 Reflecting its reliance on fossil fuels, the electric power industry produces the majority of the world's greenhouse gas emissions. The need for a revolution in the industry becomes further apparent given that decarbonization means an increasing electrification of other sectors of the economy in particular through a switch from gasoline to electric vehicles. Of the options for producing electric power without significant greenhouse gas emissions, renewable energy is most attractive to policymakers as it promises increased national self-reliance on energy supplies and the creation of new industries and jobs without the safety and political concerns of nuclear power or the unproven technology of carbon capture and storage.

Drawing on both economic theory and the experiences of the United States and EU member states *Harnessing Renewable Energy* addresses the key questions surrounding renewable energy policies How appropriate is the focus on renewable power as a primary tool for reducing greenhouse gas emissions If renewable energy is given specific support what form should that support take What are the implications for power markets if renewable generation is widely adopted Thorough and well evidenced this book will be of interest to a broad range of policymakers the electric power industry and economists who study energy and environmental issues *Renewable Energy UK* Great Britain. Department of Energy,1985

Renewable Energy Sources in the United Kingdom. United Kingdom National Paper ,1981 *Path Dependence and New Path Creation in Renewable Energy Technologies* James Simmie,2016-01-08 Why are old technologies persisted with after better alternatives have been invented This book examines this question a central concern of evolutionary economics specifically focusing on renewable energy technologies The concept of path dependence is used to analyse why and how technological development can become locked in to inefficient ways of doing things This book shows how lock in can be avoided by the creation of new technological pathways The chapters focus on the comparatively recent introduction of new wind turbine technologies for the generation of carbon free electricity This case study provides valuable lessons in understanding the issues confronting inventors attempting to commercialise their new ideas in the form of innovations in the face of historically established conventional technologies It is also set within the critical debate on climate change and the need to de carbonise energy supplies in order to stop further man made deterioration in the global environment This book was originally published as a special issue of European Planning Studies *Offshore Renewable Energy* Iea-Retd (Stichting Foundation Renewable,2013-03-01 Wave tidal and offshore wind technologies have long held the promise of seemingly limitless energy supplies In practice while offshore wind is growing relatively rapidly all three sectors have lagged behind expectations This book from the International Energy Authority Renewable Energy Technology Deployment implementing agreement IEA RETD examines the reasons for this and suggests how barriers to deployment might be overcome Beginning with an assessment of the marine energy resource it provides a detailed introduction to the main technologies currently being employed to harness wind tidal and offshore wind power It then examines the types of policies which are used to encourage deployment around the world and progress towards meeting targets The economics of offshore energy projects are discussed along with risks that projects face and the types of finance which are available A final section turns to barriers both technical and non technical including environmental health and safety skill related supply chain and more and in all cases suggests how to mitigate and remove these barriers Highly illustrated in full colour this is an indispensable resource for anyone whether in industry policy or academia looking to learn more about how deployment of offshore renewable energy technologies can be encouraged
