Laser-Enhanced Ionization Spectroscopy John C. Travis, Gregory C. Turk, 1996-04-19. Laser enhanced ionization (LEI) is a type of optical spectrometry that employs photoexcitation to ionize atoms selectively. Over the past two decades, this method, originally known as the optical galvanic effect, has been the object of extensive worldwide research and the subject of numerous papers and published articles. Until now, however, no single volume has presented this wealth of theory and data in a cohesive and accessible form. *Laser Enhanced Ionization Spectrometry* fills this gap in the literature. It synthesizes vast amounts of information previously available only through scattered research papers and covers every aspect of the technology from underlying principles and theory to methodology and applications. This book examines the state of the art of LEI, compares it with other methods and demonstrates how laser enhanced collisional ionization is especially well suited to analytical atomic spectrometry. The contributors to this collaborative effort from Russia, Australia, Europe and the United States clarify terminology, explain the inner workings of LEI and offer derivations for both idealized forms and realistic approximations. They also analyze the capabilities and limitations of this technique as an analytical method, including instrumentation, sources of noise, limits of detection, interferences and applications. After concentrating largely on flame LEI as the most commonly used method to derive LEI measurements, the discussion moves to the development of nonflame technologies for LEI. There is also extended coverage of the relationship between LEI and laser induced fluorescence, including an examination of the interplay of laser induced ionization and fluorescence techniques in different atomic and molecular reservoirs. *Laser Enhanced Ionization Spectrometry* places understanding, usefulness and practical applications ahead of detailed derivations. For practicing analytical chemists and spectroscopists, it offers a clear and uncluttered approach to a complex subject as well as a fresh perspective on a still emerging technology. This book sums up the present understanding and state of the art of laser enhanced ionization (LEI), a unique but underutilized tool for analytical atomic spectrometry. LEI possesses the special ability to ionize atoms selectively. The text focuses on the role of this technology in analytical chemistry and covers both theory and applications in one complete self-contained volume. Carefully crafted by leading experts from around the globe, with contributions under six key headings, *Laser Enhanced Ionization Spectrometry* draws on hundreds of research papers to create a comprehensive reference for LEI. Describes in depth how ions are produced and how a signal is generated and

detected Provides an extensive and up to date compilation of published LEI detection limits Emphasizes basic understanding and practical applications rather than detailed derivations Discusses terms and definitions and clears up sources of confusion in the field Offers up to date coverage of instrumentation and applications Evaluates the usefulness of LEI as an analytical tool Deals with questions of limits of detection interference and noise Devotes an entire segment to nonflame technologies for LEI Extends the discussion to fluorescence techniques and how they can be interrelated with LEI in various atomic and molecular reservoirs
