The aim of our study was to investigate organic solvents as chemical risk factors of the work environment in different branches of the industry in Latvia during 1998–2006 and to evaluate the possible impact of solvents to worker health according to the exposure index. The work conditions were studied in 116 enterprises of different branches of industries in Latvia. The analysis of 1790 measurements showed that organic solvents in the work environment have different degrees of exposure probability risk on worker health. The exposure levels in workplaces differ. More than half of surveyed workplaces (56.7%) had a low organic solvent exposure probability level, in 25.2% workplaces it was medium, and in 18.1% workplaces high. The most widely used organic solvents were aromatic hydrocarbons, which was recorded in 35% of the measurements made during assessment of aromatic hydrocarbon group organic solvent exposure in the work environment. In most workplaces several solvents were present simultaneously. Since solvents have a one-way effect on the human body, the actual exposure risk level is higher than shown when evaluating the exposure index of a single solvent only.

Key words: risk factors of work environment, organic solvents, exposure indexes, chemicals of different classes.

INTRODUCTION

Organic solvents are a structurally, physically and chemically heterogeneous group of chemical compounds; the compounds they comprise have some common properties (high oil solubility, liquid state of aggregation, relatively low price), which is why they are widely used in different production processes (Xiao and Levin, 2000).

Organic solvents are a potential work environment risk factor for workers who are employed in sectors of economic activity such as production and use of lacquers and paints, chemical industry, engineering industry, wood processing, chemical laboratories, printing-houses, specific fields of medicine (diagnostic laboratories, disinfection activities), construction sector, dry cleaners, and car and motorcycle servicing. Handling of loose solvents (application of paints, dissolved in a solvent, by means of a pulveriser or brush on the surface) and simple defatting operations (for instance, defatting of metal surfaces before galvanization in defatting baths) are carried out both in small companies and in large and well-organised enterprises. All solvents used in the work process can be emitted in the work environment air in

the form of vapour. Thus, a worker who is doing this work, as well as any other person present in the work room, can inhale chemical substances. Poisoning via the respiratory tract is the most dangerous, because gases and vapours of chemical substances are able to absorb through the respiratory mucous membrane along its entire length, travelling directly into blood and bypassing liver, which acts as a mechanical and biochemical barrier. When dealing with chemical substances and chemical products, for example, manually washing and defatting components, cleaning surfaces and spreading a coating, substances can be absorbed through skin. All of the mentioned oil soluble substances easily absorb through intact skin. Some substances can soften the upper layer of skin (solution of washing soda, solutions of surface-active substances), thus reinforcing the ability of other substances to absorb through the skin and penetrate into the blood. Since skin participates in the breathing process, gases can also absorb through the skin (Boman, 2000; Eglīte, 2000; Baķe, 2002).

Organic solvents can be characterised also by their physical risk determined by the physical and chemical properties and states of substances, of which the most important are com-

Assessing the Human Health Risks of Trichloroethylene National Research Council,Division on Earth and Life Studies,Board on Environmental Studies and Toxicology,Committee on Human Health Risks of Trichloroethylene,2007-01-08 Trichloroethylene is a chlorinated solvent widely used as a degreasing agent in industrial and manufacturing settings It is also used as a chemical intermediate in making other chemicals and is a component of products such as typewriter correction fluid paint removers adhesives and spot removers In 2001 EPA issued a draft health risk assessment and proposed exposure standards for trichloroethylene PA s Scientific Advisory Board SAB reviewed the draft and it was issued for public comment A number of scientific issues were raised during the course of these

reviews Assessing the Human Health Risks of Trichloroethylene identifies and assesses the key scientific issues relevant to analyzing the human health risks of trichloroethylene considering pertinent toxicologic epidemiologic population susceptibility and other available information including relevant published scientific literature EPA's 2001 draft health risk assessment of trichloroethylene scientific and technical comments received by EPA from public and private sources and additional relevant information to be provided by the sponsoring agencies This report highlights issues critical to the development of an objective realistic and scientifically balanced trichloroethylene health risk assessment Guidance for hazard characterization of trichloroethylene is presented in Chapters 2 through 10 Chapter 2 provides guidance for evaluating large sets of epidemiologic data In Chapter 3 the committee applies this guidance as an example in its evaluation of the epidemiologic data on trichloroethylene and kidney cancer and this example should help guide evaluations of other cancer risks Chapter 3 also assesses new information on the kidney toxicity of trichloroethylene and its metabolites and potential modes of action Chapters 4 5 6 7 and 8 evaluate the key issues regarding liver toxicity and cancer reproductive and developmental toxicity neurotoxicity respiratory tract toxicity and cancer and immunotoxicity respectively However the committee's review focused on mode of action information to understand how trichloroethylene might affect certain processes differently in different species Chapter 9 discusses susceptibility to trichloroethylene and its metabolites and Chapter 10 describes important factors in considering trichloroethylene in mixtures Physiologically based pharmacokinetic models are evaluated in Chapter 11 and guidance is provided on future directions for model development Finally Chapter 12 considers issues related to dose response assessment and quantitative assessment of risk
