Magnetic Resonance Imaging of Bone and Soft Tissue Tumors and Their Mimics A.M.A. de Schepper, A.D.

Degryse, 2012-12-06 Magnetic resonance imaging has already become a most valuable imaging modality in the diagnostic work up of musculoskeletal neoplasms While high accuracy of MRI for staging purposes has been proven we will focus in this monograph on the characterization of primary bone and soft tissue tumors by MRI The major purpose of this monograph is to provide an atlas of magnetic resonance features of primary bone and soft tissue tumors for radiologists orthopedic surgeons and physiotherapists The results presented are based on investigations of 94 primary bone and soft tissue tumors and mimicking conditions by magnetic resonance imaging Although the scale of the material allows for statistical handling the number of patients per subgroup is too small to come to definite conclusions We will therefore limit ourselves to the description of and comments on a great number of cases to illustrate the diagnostic potential of this new imaging modality We would like to thank the anonymous cooperators referring clinicians pathologists nurses technicians and secretaries whose help enabled us to present this monograph We would also like to express our gratitude to the firms Siemens AG and Schering

with continuously evolving innovations *MRI of the Brain, Head, Neck and Spine* Jaap Valk, 2012-12-06 With the growing number of MR installations clinicians and radiologists are being confronted more and more with visual information they do not feel as confident with as with the more monoform information of conventional radiographs CT and US The freedom of parameter choice of the MR operator allows the same object to be depicted in various ways and the contrast in the images to be changed and inverted at will For those not experienced in interpreting MR images this may cause confusion and uncertainty about their diagnostic content This will sometimes lead to an unnecessary retreat to other diagnostic modalities The purpose of this book is to help close the gap between MR operators and readers and clinicians A variety of cases is presented together with the MRI considerations In nearly all these cases confirmation of diagnosis was obtained by histological examination Quite deliberately this book only includes the occasional CT scan or angiography for comparison to avoid the temptation of falling back on other modalities and of escaping from the often more difficult to interpret but in the end more rewarding MR images All the MR images in this book were made with a first generation unsophisticated Teslacon I 0.6 T superconducting magnet system Hopefully they will reflect the quality of the machine Some people will agree with me that it is sad that investments in expensive health care systems are subject to the whims of those who are mainly interested in satisfying their stockholders
