Biodiversity in Agricultural Landscapes of Southeastern Brazil Carla Gheler-Costa, Maria Carolina Lyra-Jorge, Luciano Martins Verdade, 2016-04-11 The state of S o Paulo Brazil is one of the most densely populated and developed areas in South America Such development is evident both in terms of industrialization and urbanization as well as in agriculture which is heavily based on sugar cane Eucalyptus plantations and livestock This intense land use has resulted in

great alteration of the original land cover and fragmentation of natural ecosystems For these reasons it is almost a paradox that jaguar a species that requires large areas of pristine forest to exist is still found in some parts of the state of S o Paulo It is possible that wild animals could leave in coexistence with intense land use or is it the case that such rare encounters with large wild animals in S o Paulo will disappear in the near future All ecologists are aware of the problems of habitat changes caused by humans but it was not until recent years that researchers started to consider that the land used for production could also serve as an important habitat for many different kinds of wild species This book is about this new approach to conservation It also highlights the important role that sciences could and should have in this discussion in order to better understand the problems and propose possible solutions
