*Multi-attribute group decision-making method based on weighted partitioned Maclaurin symmetric mean operator and a novel score function under neutrosophic cubic environment* Jianping Fan, Shanshan Zhai, Meiqin Wu, Neutrosophic cubic set NCS is the generalized version of neutrosophic sets and interval neutrosophic sets It can deal with the complex information by combining the neutrosophic set NS and cubic set CS The partitioned Maclaurin symmetric mean PMSM operator can reflect the interrelationships among attributes where there are interrelationships among attributes in the same partition but the attributes in different partitions are irrelevant To effectively gather neutrosophic cubic information we extend the PMSM operator to neutrosophic cubic environment and define the neutrosophic cubic partitioned Maclaurin symmetric mean NCPMSM operator and neutrosophic cubic weighted partitioned Maclaurin symmetric mean NCWPMSM operator Later we define a novel score function of NCS which overcome the drawbacks of the existing score functions Next based on NCWPMSM operator and the novel score function we develop a multi attribute group decision making method Finally we give an example of supplier selection to illustrate the usefulness of the proposed multi attribute group decision making MAGDM method At the same time a comparative analysis is to show the effectiveness and advantages of the proposed method compared with the existing methods

Based on the reviewers' reports, 251 papers were accepted for oral presentations while 99 were accepted for poster presentations. In other words, only slightly over 33% of the submitted papers were accepted by this conference. The rate of acceptance was lower than one third of the total submissions.

**Handbook of Markov Decision Processes** Eugene A. Feinberg, Adam Shwartz, 2012-12-06 Eugene A. Feinberg, Adam Shwartz This volume deals with the theory of Markov Decision Processes (MDPs) and their applications. Each chapter was written by a leading expert in the respective area. The papers cover major research areas and methodologies and discuss open questions and future research directions. The papers can be read independently with the basic notation and concepts of Section 1.2. Most chapters should be accessible by graduate or advanced undergraduate students in fields of operations research, electrical engineering and computer science.

1.1 AN OVERVIEW OF MARKOV DECISION PROCESSES The theory of Markov Decision Processes, also known under several other names including sequential stochastic optimization, discrete time stochastic control and stochastic dynamic programming, studies sequential optimization of discrete time stochastic systems. The basic object is a discrete time stochastic system whose transition mechanism can be controlled over time. Each control policy defines the stochastic process and values of objective functions associated with this process. The goal is to select a good control policy. In real life decisions that humans and computers make on all levels, usually have two types of impacts: i) they cost or save time, money or other resources, or they bring revenues as well as ii) they have an impact on the future by influencing the dynamics. In many situations, decisions with the largest immediate profit may not be good in view of future events. MDPs model this paradigm and provide results on the structure and existence of good policies and on methods for their calculation.
