Melatonin: A Universal Photoperiodic Signal with Diverse Actions P. L. Tang, S. F. Pang, R. J. Reiter, 1996-12-05
This timely publication describes several newly identified functions of melatonin and discusses the findings in terms of melatonin's actions on the neuroendocrine axis, the immune system, the gastrointestinal tract, and the pulmonary and cardiovascular systems in organisms ranging from unicellular animals to humans. Containing the most recent experimental data on the receptors which mediate the effects of the pineal hormone melatonin, this volume shows that melatonin receptors are more widely distributed than originally thought and exhibit wide species variations in terms of their distribution and density. In addition, multiple subtypes of melatonin receptors are identified. These findings indicate that melatonin is a ubiquitously acting molecule which mediates a variety of physiologically important actions. *Vertebrate Ecophysiology* Don Bradshaw, 2003-04-24 Ecophysiology attempts to clarify the role and importance of physiological processes such as digestion and respiration in the ecological relations of species in their natural habitats. The basic principles and methods that are central to any ecophysiological study are outlined and discussed, including animal capture, blood collection, and the measurement of plasma components and hormone levels. Attention is paid to animal welfare and ethical considerations, and the question of stress and how to identify its presence in animals in their natural environment is approached through a series of case studies. Examples are given from a wide range of vertebrates living in deserts, cold climates, and oceans, and recent findings on the physiological adaptations of Antarctic birds and mammals are a highlight of the book. This textbook will provide an introduction to the study of ecophysiology for advanced undergraduates and postgraduate students, as well as researchers in ecology, biodiversity, and conservation. *Biological Signals*, 1997 *Hormones*, 1997 **New Books in the Veterinary Medicine Library** Ohio State University Libraries. Shiu, S. F. Pang, 2000 Previous hopes and hopes have clouded the use of melatonin, the pineal gland indoleamine hormone, as a health food supplement. Recently, however, significant advances have been made in our understanding of the signal transduction mechanisms of many well-known and potential physiological and pharmacological

actions of melatonin in mammals This timely publication was put together by an international group of pineal researchers whose major research focus is unraveling the mammalian physiology and pharmacology of melatonin at the cellular tissue and organismic levels It collates the latest scientific information on the receptor and non receptor mediated mechanisms of melatonin actions The respective articles address the roles played by G protein coupled melatonin receptor subtypes in the modulation of biological rhythms in mammals including the seasonal reproductive responses The different functions of membrane and nuclear melatonin receptors in the regulation of mammalian immune responses and epididymal cell biology are also discussed In addition the biochemical mechanisms of the free radical scavenging functions of melatonin using physiological and pharmacological concentrations are authoritatively reviewed in the specific contributions of this publication
