Membrane Pathobiology Of Tropical Diseases

Membrane Pathobiology Of Tropical Diseases:

The Membrane Pathobiology of Tropical Diseases, 1979 *The membrane pathobiology of tropical diseases*, 1978

The Biology of Trypanosomes Leslie Hudson, 2012-12-06 African and South American trypanosomiasis are notable features of clinical and veterinary practice in their respective endemic areas and as such are of considerable economic importance. Scientifically, however, their importance extends beyond their clinical significance as the trypanosomes are intriguing and easily manipulated models for the study of the control of gene expression, membrane chemistry, proliferation and differentiation. It is clear from the scientific press that the rate of advance has hotted up in these areas of trypanosome research over the past 5 years and so a single topic volume within the scope of the present series seemed timely. As ever the final admixture of review topics was a compromise between what was appropriate and what was available, fortunately with the former in vast excess. I should like to highlight two omissions made for entirely different reasons. The first is a detailed treatment of the molecular biology of the variant surface glycoproteins of the African trypanosomes, in particular *Trypanosoma brucei* and *T. equiperdum*. This topic has been the subject of several reviews, for example BORST and CROSS 1982 1 and TURNER 1982 2 and so was excluded from the present volume. The second omission is a review of the first class work on genetic recombination from the group of Dr Leo Jenni at the Schweizerisches Tropeninstitut Basel. This group has used isoenzyme markers to show that *T. brucei* is a natural recombinant.

Current Catalog National Library of Medicine (U.S.), 1980. Includes subject section, name section and 1968-1970 technical reports.
