## **Membrane Receptors:**

*Thermodynamics of Membrane Receptors and Channels* Meyer B. Jackson, 1992-11-18 *Thermodynamics of Membrane Receptors and Channels* synthesizes a wealth of new information regarding the biophysics of membrane proteins. New insights provided by molecular genetics, single channel recording, and high resolution structural techniques are discussed from a conceptual perspective. Basic theoretical topics are introduced, developed, and then extensively illustrated with recent results from the literature or data from the authors' own laboratories. Theoretical and experimental information is incorporated into in-depth discussions of ion permeation mechanisms, ion channel and receptor conformational changes, aggregate activity of complexes of lipids and proteins, and how coupling is achieved between different energy modes in the many transduction systems residing in biomembranes. *Thermodynamics of Membrane Receptors and Channels* will be valuable both as a learning aid and a reference for biophysicists, neuroscientists, cell biologists, physiologists, and other researchers investigating any aspects of biomembranes.

**Membrane Receptors** P. Cuatrecasas, 2013-03-09 Hardly a decade ago, membrane receptors were an attractive but largely unproven concept. Since that time, enormous progress has been made, and we are now able to consider receptors much more concretely. Their existence has been established; their binding properties have been determined, and in some cases they have been highly purified, and their physical-chemical properties studied. It is now even possible to visualize microscopically some receptors. This progress has resulted largely from the development of highly powerful methods. These methods are the subject of this volume. Although considerably diverse, different receptors share certain common properties, and common problems are encountered in their study. Consequently, a small number of techniques are particularly useful in studying different types of receptors. Thus, it makes sense to speak about membrane receptor methodology. A very apparent problem in the study of membrane receptors is their presence in exceedingly small quantities and in a highly impure state. Therefore, very sensitive and specific techniques are required for their detection, characterization, and purification. Such sensitivity and specificity is provided by the ability of receptors to bind certain ligands with very high affinity, and it is not surprising that most of the methods described in this volume depend upon this high-affinity binding. The antigen-antibody interaction is of comparable sensitivity and specificity. Recently, a number of anti-receptor antibodies have been produced or found to occur spontaneously in autoimmune diseases. Undoubtedly, more will be produced in the future.

**Surface Membrane Receptors** Ralph Bradshaw, 2012-12-06 The NATO Advanced Study Institute entitled *Surface Membrane Receptors: Interface Between Cells and Environment* was held in Bellagio, Italy, September 13-21, 1975. This meeting was an attempt to bring together in an international and interdisciplinary forum scientists who are studying recognitive phenomena which take place at the surface membrane of cells. While an attempt was made to restrict the subject areas covered at the meeting to those experimental systems which have been biochemically characterized to some extent, it will also be noted that some contributions to this volume represent a preliminary iden-

tification of interesting regulatory substances which might reasonably be expected to act at the cell surface This book is divided into four sections reflecting the subject areas covered during the course of the meeting The first section entitled Membrane Structure and Receptor Function is intended as an overview of the role of membrane structure in determining the regulatory properties physical state structure and location of cell surface receptors It should be noted that the plasma membrane itself provided the unifying theme for the intention ally diverse contributions to this volume The following three sections represent an arbitrary division into three levels of structural complexity of the things in their external environment with which cells must specifically interact Membrane Receptors, Dynamics, and Energetics K. **Molecular Mechanisms of Membrane Fusion** Shinpei Ohki, 2012-12-06 Membrane fusion is an important molecular event which plays a pivotal role in many dynamic cellular processes such as exocytosis endocytosis membrane biogenesis fertilization etc While many reports on the physico chemical process involved in membrane fusion have appeared in the literature and much information has accumulated there has been no comprehensive meeting of workers in the field A recent symposium which

took place at the Center for Tomorrow State University of New York at Buffalo New York April 27 29 1987 was the first meeting of its kind to specifically address the molecular mechanisms of membrane fusion The Symposium consisted of oral workshop and poster presentation sessions The papers presented in the oral and workshop sessions are collected here and arranged approximately in the order presented at the Symposium These papers are the most up to date and representative work at the for front of each aspect of membrane fusion Although the readers may find some differences in interpretations regarding the molecular mechanisms of membrane fusion there is an over all concensus that increased hydrophobicity and dehydration of the membrane surface are essential physico chemical factors for membrane fusion to occur We trust that these papers will contribute to your further understanding of the mechanisms of membrane fusion
