ABSTRACT

In patients' perception, chemotherapy-induced nausea and vomiting (CINV) are the main treatment-related adverse events of anti-cancer treatment. The probability of CINV incidence depends on the treatment regimen, dose, administration route, and patient-dependent factors. According to the current guidelines, a combination of setrons, neurokinin-1 receptor antagonists, and glucocorticoids results in control of acute emesis in 80–90% of patients and delayed emesis in 80–80%. Despite the availability of recommendations for prophylaxis CINV, the level of adherence to the guidelines in clinical practice is lower than observed in trials. Only half of the patients with highly and moderately emetogenic chemotherapy receive prophylaxis consistent with recommendations. Overuse of 5-hydroxytryptamine-3 receptor antagonists, incorrect dosing of corticosteroids, and overuse of metoclopramide in prophylaxis of delayed emesis are the main issues of non-adherence. Possible reasons for non-adherence are: insufficient knowledge of the guidelines, inappropriate CINV risk assessment, underestimation of symptoms reported by the patients, and difficulties in communication between a patient, medical personnel, and physician. To improve adequate control of CINV and adherence to the guidelines repetitive educational, administrative, and scientific actions need to be taken.

Key words: nausea, vomiting, chemotherapy, guidelines

Introduction

Chemotherapy-induced nausea and vomiting (CINV) are among the most frequent side effects of anticancer therapy. Patients consider CINV as the main complication of planned chemotherapy. CINV have a negative impact on the quality of life (QoL) during the treatment and remain the main cause of stress, discomfort, and limited social, professional, and personal activity. The estimated rate of CINV in chemotherapy patients amounts to 70% [1]. Persisting CINV may: cause hydroelectrolytic imbalance, modify the primary treatment schedule, reduce the optimal doses of the drugs, and consequently decrease the efficacy of the anticancer therapy. The probability of the occurrence of CINV depends on the treatment scheme, the drug dose and administration route, and on patient-related factors.

Despite the easy accessibility of the antiemetic prophylaxis recommendations during chemotherapy,

the rates of CINV control and of adherence to supportive care standards remains unsatisfactory in clinical practice. This article reviews the process of introducing the antiemetic standards and analyses the difficulties in the use of the CINV prophylaxis recommendations in clinical practice.

Drugs used in the prophylaxis of chemotherapy-induced nausea and vomiting (CINV)

Until the mid 1990s, pronounced CINV were one of the reasons to terminate chemotherapy. The introduction of the antagonists of the serotonin (5-hydroxytryptamine) binding to its type 3 receptors (5-HT₃, 5-hydroxytryptamine receptor type-3) to the routine use

Chemotherapy-Induced Nausea and Vomiting Rudolph M. Navari,Bernardo L. Rapoport,2016-04-18 Few side effects of cancer treatment are more feared by patients than nausea and vomiting Failure to control these symptoms on the first day of chemotherapy increases the risk of them occurring on subsequent days and in subsequent cycles of chemotherapy and can often result in patients refusing further cancer treatment Very effective antiemetics are available to prevent this from happening but do you know how best to use them Fast Facts Chemotherapy Induced Nausea and Vomiting presents the evidence for the clinical agents that can prevent CINV along with the recommendations for their use in various clinical settings using recently established international guidelines Correct administration of prophylactic antiemetics in relation to the emetogenicity of the chemotherapy being given not only improves patients quality of life during treatment but also adherence to subsequent cancer treatments thus improving overall outcomes This refreshingly readable handbook is therefore a must read resource for all health professionals in a position to make this kind of a difference Contents Definitions and pathophysiology Types of CINV and risk factors Antiemetic agents Prevention and management of acute and delayed CINV Treatment of breakthrough refractory and anticipatory CINV Prevention and treatment of chemotherapy induced nausea Barriers and opportunities in CINV management *Prevention of Nausea and Vomiting in Cancer Patients* Matti

Chemotherapy-Induced Nausea and Vomiting Rudolph M. Navari,2016-01-25 This book provides a comprehensive review of new agents a detailed description of new uses of current agents and an integration of the available agents in clinical practice A description of a detailed clinical approach provides clinical practitioners with the most up to date recommendations for the prevention and treatment of chemotherapy induced nausea and vomiting CINV in various clinical settings CINV is one of the most feared treatment related toxicities Patient surveys for the past thirty years consistently demonstrate patients perception of deterioration in quality of life due to chemotherapy treatments The introduction of the

antiemetics serotonin 5 HT3 receptor antagonists and the neurokinin 1 receptor antagonists have improved the control of chemotherapy induced emesis but the treatment of chemotherapy induced nausea remains a significant clinical problem Patients continue to have quality of life issues which prevent normal functioning during active treatment New agents such as the second generation 5 HT3 receptor antagonist palonosetron and the new neurokinin 1 receptor antagonists rolapitant and netupitant are being introduced into clinical practice and it is anticipated that these new agents will improve the control of CINV Agents such as olanzapine a FDA approved anti psychotic gabapentin a FDA approved neuroleptic and ginger a food additive which have been used primarily for other indications are now being tested as potential effective antiemetics This work represents the first available comprehensive summary that details all new antiemetic agents and particularly their clinical role in treating patients an important reference for practitioners seeking to improve the quality of life of patients undergoing chemotherapy

11 - PREVENTION OF CHEMOTHERAPY- INDUCED NAUSEA AND VOMITING WITH PALONOSETRON: A SINGLE CENTER AUDIT Xiaoxiao Huang,2017 PREVENTION OF CHEMOTHERAPY INDUCED NAUSEA AND VOMITING WITH PALONOSETRON A SINGLE CENTRE

AUDIT Introduction Palonosetron has largely replaced first generation 5 HT3 receptor antagonists for the prevention of chemotherapy induced nausea and vomiting in single day chemotherapy The aim of this audit was to confirm that chemotherapy induced nausea and vomiting is sufficiently prevented using IV palonosetron in combination with other antiemetics recommended in guidelines Methods This audit was conducted in the cancer care outpatient unit in an Australian tertiary hospital Eligible patients who had chemotherapy with palonosetron were identified using the electronic prescribing system Consented patients completed a questionnaire on nausea severity emesis rescue medications and their effectiveness from day 1 to day 5 of chemotherapy Results A total of 82 patients were included and 40 patients responded 22 55% 13 33% and 5 13% patients received highly moderately and low emetogenic chemotherapy respectively 32 80% patients received at

lease MASCC recommended antiemetic regimen but not olanzapine Overall one patient had vomiting and 24 patients 60% experienced nausea 64% 62% and 40% of patients received highly moderately and low emetogenic chemotherapy respectively Clinically significant score 3 out of 10 nausea was experienced by 13 33% patients Similar numbers of patients experienced nausea from Day 1 to 5 Rescue antiemetics were used by 17 42 5% patients Metoclopramide was the most frequently used antiemetic followed by ondansetron and Olanzapine Conclusions Vomiting was sufficiently prevented by the recommended antiemetics including palonosetron However majority of patients still experienced acute and delayed nausea

Guidelines For The Prevention Of Chemotherapy Induced Nausea And Vomiting (CINV) Do Not Address Economic Variation, Affordability In Different Populations, And Drug Availability Jose Galeas, 2017 Introduction Several organizations have published effective guidelines for CINV Evidence u2013based guidelines list the best known regimens for prevention of CINV in different emetic risk groups While useful this approach may not address economic realities of availability and affordability of antiemetics in most countries and for most patients Objectives Establish a framework addressing affordability of CINV regimens in different economic settings to indicate guidance for improving antiemetic control Methods We examined current guideline recommendations in 5 CINV risk categories from high to minimal risk and as a consensus group listed regimens for each setting as a Good regimen a Better regimen or Best regimen The World Bank WHO established four economic groups into which each nation is placed Additionally the WHO approached healthcare affordability based on income levels per country especially minimum wage Acquisition price and availability of recommended antiemetics in each country was determined Results The greatest economic issues were seen in the two top emetic risk groups where NK1 based regimens were often not affordable except in the highest income nation group but not in all these countries Widespread availability of generic agents has improved affordability Two agent regimens were affordable in most economic groups as were olanzapine based three agent regimens Differences still existed among countries of the same economic group Conclusions The Best antiemetic regimen should always be used where it is available and affordable Where economic realities exist limiting Best regimen use Good and Better regimens provide realistic CINV prevention for many nations This model may be useful in other oncology settings The Bethesda Handbook of Clinical Oncology Sayan Paul, 2020-09-01 The Bethesda handbook of clinical oncology has been thoroughly reviewed and Ed it Ed by a group of renowned oncologists from reputed government and private cancer institutes of India to make the contents relevant and useful for the students and practitioners of oncology of the Indian subcontinent and South Asia Salient features data and evidences from India and South Asia have been added All the chapters have been edited and updated as per most recent available evidences and guidelines More emphasis has been given to the type of cancers more commonly seen in this part of the world such as head and neck cancer cancer cervix breast cancer etc Chapters of basics of Radiation oncology and medical oncology have been revised Additional and relevant information on cancer surgery has been added in each br

Chapter a management Flowchart has been added at the end of each br Chapter for easy understanding and ready reference in the clinic
