

5. Conclusion

This paper we have studied an approach of modeling and control of photovoltaic system. In this work, the aim was to control the voltage of the solar panel in order to obtain the maximum power possible from a PV generator, whatever the solar insolation and temperature conditions. The results obtained with this solution confirm the good performances of the proposed solution. The results obtained are full of promises to use the inverter in high voltage and great power applications as electrical power applied to decentralized power generation is based on Power direct control. In PV system the maximum power point tracked by fuzzy logic method. It is more efficient method and its mathematical equations are there. The topology is simulated using MATLAB and analyzed. The harmonics was reduced in the output waveform of the diode clamped multilevel inverter. The hardware circuit is built and the experiments are carried out to test the performance of the circuit.
