## Readings In Clinical Spectrography In Speech:

*Readings in Clinical Spectrography of Speech* Ronald J. Baken, Raymond Daniloff, 1991      *Investigations in Clinical Phonetics and Linguistics* Fay Windsor, M. Louise Kelly, Nigel Hewlett, 2012-12-06

*Investigations in Clinical Phonetics and Linguistics* is a sequel to the eighth meeting of the International Clinical Phonetics and Linguistics Association attended by delegates from 26 different countries. This book reflects the scope of the subject area of clinical phonetics and linguistics, the balance of input into it with respect to the different kinds of research being carried on and the representation of researchers from different parts of the world. Its scope includes the application of all levels of linguistic analysis and the chapters of the book have been ordered as far as possible according to linguistic level, beginning with pragmatics and ending with acoustics. It will be immediately apparent that a greater number of chapters are concerned with applications of phonetics and phonology than with any other levels.

*Acoustics and Psychoacoustics* David Martin Howard, James A. S. Angus, Jamie Angus, 2001

This book provides a comprehensive introduction to the subject of acoustics, including the principles of human perception of sound, sometimes called psychoacoustics. *Acoustics and Psychoacoustics* is ideal for students of music technology, sound recording, traditional music and acoustics, as well as engineers studying audio multimedia and communications systems. Anyone who wants a practical understanding of how real musical sounds behave and are perceived in real spaces will find this an accessible and interesting read. Subjects featured include Principles of sound, Human hearing and psychoacoustics, Musical timbre, pitch and loudness perception, Sound generation in musical instruments, Sound in different environments, architectural acoustics, Processing sound electronically. The book's second edition provides new material on wave motion, brass and woodwind instruments, forward and backward masking, an introduction to coding and diffusion. Additional references and marginal notes explaining basic terms are provided to aid understanding. Supporting website: <http://www.users.york.ac.uk/dmh8/AcPsych/acpsyc.htm>. Visit the book's supporting website designed by author David Howard for additional resources, Questions and exercises to test your knowledge, Web links for further resources and research, Audio clips, Calculation facilities (e.g. adding decibel values and converting between frequency ratio and cents, semitones). The website can also be reached via [www.focalpress.com](http://www.focalpress.com). Professor David M Howard lectures on music technology at the University of York's Electronics Department. His research interests include the analysis and synthesis of music, speech and singing, human hearing, modelling and the use of computer displays in voice teaching. He is an active organist, choral singer and choral conductor. Dr James Angus was an instigator of the music technology courses at York where he formerly lectured. He is now an independent consultant and researches in the area of acoustics, in particular diffuser design and audio signal processing. *Acoustics and Psychoacoustics* is part of the Focal Press Music Technology Series.

**Time Domain Representation of Speech Sounds** Asoke Kumar Datta, 2018-11-03 The book presents the history of time domain representation and the extent of its development along with that of spectral domain representation in the cognitive and technology domains It discusses all the cognitive experiments related to this development along with details of technological developments related to both automatic speech recognition ASR and text to speech synthesis TTS and introduces a viable time domain representation for both objective and subjective analysis as an alternative to the well known spectral representation The book also includes a new cohort study on the use of lexical knowledge in ASR India has numerous official dialects and spoken language technology development is a burgeoning area In fact TTS and ASR taken together constitute the most important technology for empowering people As such the book describes time domain representation in such a way that it can be easily and seamlessly incorporated into ASR and TTS research and development In short it is a valuable guidebook for the development of ASR and TTS in all the Indian Standard Dialects using signal domain parameters

*An Introduction to the Science of*

*Phonetics* Nigel Hewlett, Janet Mackenzie Beck, 2013-04-03 The book is designed as an introduction to the scientific study of speech No prior knowledge of phonetics is assumed As far as mathematical knowledge is concerned all that is assumed is a knowledge of simple arithmetic and as far as possible concepts are dealt with on an intuitive rather than mathematical level The anatomical material is all fully explained and illustrated The book is arranged in four parts Part 1 Basic Principles provides an introduction to established phonetic theory and to the principles of phonetic analysis and description including phonetic transcription Part 2 Acoustic Phonetics considers the physical nature of speech sounds as they pass through the air between speaker and hearer It includes sections on temporal measurement fundamental frequency spectra and spectrograms Part 3 Auditory Phonetics covers the anatomy of the ear and the perception of loudness pitch and quality The final part Part 4 covers the articulatory production of speech and shows how experimental techniques and tools can enhance our understanding of the complexities of speech production Though the audience for this book is mainly students and professors in the Speech Sciences it will also be valuable to any students studying hearing science and acoustics The book is well supported with figures tables and practice boxes with experiments

Occupational Voice Philippe H. Dejonckere, 2001 Introduction The concept of occupational voice disorders Philippe H Dejonckere People using their voice professionally are at risk for occupational voice diseases and require specific prevention and treatment was the topic focused on by the third Pan European Voice Conference organized in August 1999 at Utrecht University The present book includes the main tutorial lectures with reviews of the most relevant research data and opinions regarding this specific area of concern Occupational voice users include not only singers and actors but also teachers

politicians lawyers clergymen telephone operators etc 1 The pathogenesis of voice disorders in such patients can be primarily related to their occupation and thus after adequate differential diagnosis these need to be recognized as true occupational diseases in the same way as for example occupational hearing loss 2 A surfeit of information is available on the potential damage from exposure to excessive noise levels 3 4 Noise induced hearing loss is generally recognized as a typical occupational disease The relationship between dose and effect is clear as is documented in publications by the International Organization of Standardization ISO 5 The dose combines intensity and duration and therefore the concept of dosimetry is of major importance Also of importance is the definition of the safe limits for exposure to noise However factors regarding individual susceptibility to noise and the reversibility of early effects also have to be considered as well as possible preventive indices of noise induced hearing loss 6 In some but not all respects noise induced hearing loss may be considered as a useful model for occupational voice disorders Epidemiology Titze 7 compared the percentage of the US working population and of the voice clinic load for different occupation categories for example telephone marketers constitute only 0.78% of the total workforce but 2.3% of the clinic load teachers represent 4.2% of the US workforce and 20% of the voice clinic load Studies based on questionnaires have suggested that teachers and aerobic instructors are at high risk for disabilities from voice disorders and that these health problems may have significant work related and economic effects 8 9 For example Russel et al 10 investigated the prevalence of self reported voice problems in teachers 16% of teachers reported voice problems on the day of the survey 20% during the current teaching year and 19% at some time during their career Roughly speaking we can conclude from the several studies published during the 1990s that about 20% of teachers experience voice disorders 11 Voice dosimetry Objective measurement of vocal use and vocal load is necessary for the identification of activities and working conditions that are at risk Voice dosimeters can provide information on the total vocalization time and sound pressure level over a whole working day in a real life situation 12 14 Just as noise dosimeters define acceptable levels of noise exposure voice dosimeters help to define the average acceptable limits for vocal load Hyperphonation Repeated mechanical vibrations transmitted to the body tissues by engines or machines are known to be able of eliciting in certain conditions specific kinds of pathology which are also considered to be occupational diseases 15 16 The vibration may involve the whole body e.g. in a vehicle or mainly the hand wrist elbow or shoulder hand held power tools There are standards in the field of occupational health that stipulate the acceptable limits for tissue acceleration values depending on the frequency 17 Titze's calculations suggest that the risk of damage from tissue vibration is exceeded by occupational vocalists such as telephone marketers and teachers 18 In the last few years much new and important information has materialized on the dangers of hyperphonation i.e. loud and prolonged phonation beyond the physiological range Laboratory experiments on canine larynges hyperphonated in vivo under anesthesia demonstrated obvious damage to vocal fold epithelia 19 The basement membrane shows early lesions and seems to be particularly sensitive 20 A clinical study by Mann et al 21 in drill

sergeants demonstrated significant increases in vocal fold edema erythema and edge irregularity and decreases in vocal fold mucosal wave and amplitude of excursion following a five day training period Voice fatigue relief and recovery According to Titze 18 two different aspects must be considered Muscle fatigue the muscle chemistry needs to be reset for the following contractions Epithelial cells may die and be shed due to repeated traumata New cells have to develop underneath Collagen and elastin fibers may have separated from the structural matrix of the lamina propria and have to be removed and replaced by the fibroblasts Detached protein debris will be removed and re used by the fibroblasts to make new protein fibers that will support the connective tissue structure Therefore minor destruction and repair is continuous Can the regenerative processes keep up with the destructive process and what are the physiological time constants in these processes When there is damage to the joints ligaments tendons or other connective tissue the recovery time will be proportional to the amount of localized tissue injury that has occurred If muscle fatigue is the only complaint the recovery period required will probably be shorter Hypothetical curves for tissue injury and the recovery period for human phonation have been suggested by Titze 18 Nevertheless vocal fatigue is still difficult to identify in practical and clinical situations and Buekers has questioned the clinical relevance of voice endurance tests 13 14 Environmental factors The relative humidity of the air affects vocal function the most common subjective complaints of teachers with regard to their working environment are the dryness and dustiness of the air Professional singers note that singing is more difficult in a dry environment dry air puts an increased strain on the phonatory apparatus and raises the demands on its efficacious and appropriate use 22 The human voice is very sensitive to decreases in the relative humidity of inhaled air because in experimental conditions even after short provocation a significant increase in perturbation measures has been found 23 Noise is also a very common and relatively well known risk factor in the working environment of professional voice users It has been observed that the sound level of the speaking voice significantly increases in ambient noise levels starting from 40 dB A about 3 dB for each 10 dB increase in ambient noise due to the Lombard effect 24 25 In kindergartens for example noise levels have been found to vary between 75 and 80 dB A 26 27 Effects of stress Mendoza and Carballo investigated the effects of experimentally induced stress on voice characteristics 28 In conditions of stress induced by means of a stressful environment and cognitive workload tasks they observed 1 an increase in  $F_0$  with respect to baseline 2 a decrease in pitch perturbation quotient and in amplitude perturbation quotient 3 a lower presence of turbulent noise in the spectral zone in which the existence of harmonic components is not expected 2800 5800 Hz with respect to harmonic energy in the 70 4500 Hz range 4 an increase in harmonic energy in the 1600 4500 Hz range with respect to harmonic energy in the 70 1600 Hz range The increase in  $F_0$  seems to be considered a universal indicator of stress and of cognitive workload as is the lowering of  $F_0$  perturbation The response to a stressful stimulus demands a high level of activation which in turn produces elevated ergotropic arousal that would cause an increase in the tension of the vocal muscles producing a higher and more tense voice Mattiske et al 29 report that teachers seem to experience a significant

degree of stress during their work 30 and there is some research evidence that anxiety and stress are associated with the development of voice problems 31 Marks 32 compares teachers voices with those of nurses and finds that psychological stress is reported more frequently by teachers There are indications that stress psychological tension personality and other psychological factors may play an important role in voicing problems among teachers 30 33 34 Vocal fold lesions Phonotrauma may result in typical vocal fold lesions to be interpreted as a direct consequence of mechanical stress and or as tissue reaction to that stress Vocal fold nodules and polyps are classical examples 35 36 but also contact ulcerations granulomas of the vocal processes 35 36 37 if not induced by acid re flux Vocal fold hemorrhage is generally consecutive to acute phonotrauma 35 Depending on reversibility and context microsurgery may become indicated as an important element of the treatment 38 39 Care and cure Patients with occupational voice disorders should benefit from specific medical and paramedical treatments as well as from technical aids with respect to their particular pathogenesis There are major economical aspects at stake and occupational rehabilitation plays an important role In a few cases compensation and professional re orientation is necessary Outcomes of the various possible treatment strategies have still to be investigated However prevention is still essential There are indications that vocal hygiene education programs could improve the voice by reducing vocal abuse in daily life and by practising specific strategies to maintain classroom order and to reduce the use of the voice during teaching 40 Further research is needed to demonstrate the usefulness of prevention strategies on the incidence of actual voice disorders
