Lectures on Petri Nets II: Applications Wolfgang Reisig, Grzegorz Rozenberg, 1998-11-04 The two volume set originates from the Advanced Course on Petri Nets held in Dagstuhl Germany in September 1996 beyond the lectures given there additional chapters have been commissioned to give a well balanced presentation of the state of the art in the area Together with its companion volume Lectures on Petri Nets I Basic Models this book is the actual reference for the area and addresses professionals students lecturers and researchers who are interested in systems design and would like to learn to use Petri nets familiar with subareas of the theory or its applications and wish to view the whole area interested in learning about recent results presented within a unified framework planning to apply Petri nets in practical situations interested in the relationship of Petri nets to other models of concurrent systems Completion Detection in Asynchronous Circuits Pallavi Srivastava, 2022-11-08 This book is intended for designers with experience in traditional clocked circuit design seeking information about asynchronous circuit design in order to determine if it would be advantageous to adopt asynchronous methodologies in their next design project The author introduces a generic approach for implementing a deterministic completion detection scheme for asynchronous bundled data circuits that incorporates a data dependent computational process taking advantage of the average case delay The author validates the architecture using a barrel shifter as shifting is the basic operation required by all the processors The generic architecture proposed in this book for a deterministic completion detection scheme for bundled data circuits will facilitate researchers in considering the asynchronous design style for developing digital circuits Higher-Level Hardware Synthesis Richard Sharp, 2004-03-18 In the mid 1960s when a single chip contained an average of 50 transistors Gordon Moore observed that integrated circuits were doubling in complexity every year In an in uential article published by Electronics Magazine in 1965 Moore predicted that this trend would continue for the next 10 years Despite being criticized for its unrealistic optimism Moore's prediction has remained valid for far longer than even he imagined today chips built using state the art techniques typically contain several million transistors The advances in fabrication technology that have supported Moore's law for four decades have fuelled the computer revolution However this exponential increase in transistor density poses new design challenges to engineers and computer scientists alike New techniques for managing complexity must be developed if circuits are to take full advantage of the vast numbers of transistors available In this monograph we investigate both i the design of high level languages for hardware description and ii techniques involved in translating these hi level languages to silicon We propose SAFL a rst order functional language designedspeci callyforbehavioralhardwaredescription and describe the implementation of its associated silicon compiler We show that the high level pr erties of SAFL allow one to exploit program analyses and optimizations that are not employed in existing synthesis systems Furthermore since SAFL fully abstracts the low leveldetails of the implementation technology we show how it can be compiled to a range of di erent design styles including fully

The opcode defines the types of operands Code and data are stored in a common storage that is linear addressed in units of memory words bytes words etc The overwhelming design criterion of the von Neumann computer was the minimization of hardware and especially of storage The most simple implementation of a von Neumann computer is characterized by a microar chitecture that defines a closely coupled control and arithmetic logic unit ALU a storage unit and an I O unit all connected by a single connection unit The instruction fetch by the control unit alternates with operand fetches and result stores for the AL U International Symposium on Advanced Research in Asynchronous Circuits and Systems Institute of Electrical and Electronics Engineers, Inc.
