Reeve, 2014-01-14 The Encyclopedia includes 125 entries beginning with the origins of genetics including historical background on the work of Gregor Mendel and Charles Darwin and progressing to the structure of DNA and modern theories such as selfish genes All branches of genetics are covered including the genetics of bacteria viruses insects animals and plants as well as humans Important topical issues such as the human genome project bioethics the law and genetics genetic disorders GM crops and the use of transgenic animals for food and pharmaceutical products are fully surveyed A section on techniques and biotechnology includes modern methods of analysis from DNA fingerprinting to the new science of bioinformatics The articles all written by specialists are largely non mathematical and progress from general concepts to deeper understanding Each essay is fully referenced with suggestions for further reading The text is supplemented by extensive illustrations tables and a color plate section The Encyclopedia of Genetics will be a valuable companion for all those working or studying in the various fields of genetical research and a fascinating reference for all readers with a basic background in biology Also includes color inserts

Development of the Gastrointestinal Tract Ian R. Sanderson, W. Allan Walker, 2000 The authors chronicle the development of the gastrointestinal system beginning with the embryology of the gastrointestinal tract through development of cells to hormones and enzymes Each section provides detailed explanation of that stage of development so residents and clinicians can better understand the interrelationships of each structure Special attention is given to the latest cellular information and gene promoters in the regulation of intestinal development Coverage of defects due to trauma and infections is also included

Evolutionary Developmental Biology Brian K. Hall, 2012-12-06 Although evolutionary developmental biology is a new field its origins lie in the last century the search for connections between embryonic development ontogeny and evolutionary change phylogeny has been a long one Evolutionary developmental biology is however more than just a fusion of the fields of developmental and evolutionary biology It forges a unification of genomic developmental organismal population and natural selection approaches to evolutionary change It is concerned with how developmental processes evolve how evolution produces novel structures functions and behaviours and how development evolution and ecology are integrated to bring about and stabilize evolutionary change The previous edition of this title published in 1992 defined the terms and laid out the field for evolutionary developmental biology This field is now one of the most active and fast growing within biology and this is reflected in this second edition which is more than twice the length of the original and brought completely up to date There are new chapters on major transitions in animal evolution expanded coverage of comparative embryonic

development and the inclusion of recent advances in genetics and molecular biology The book is divided into eight parts which place evolutionary developmental biology in the historical context of the search for relationships between development and evolution detail the historical background leading to evolutionary embryology explore embryos in development and embryos in evolution discuss the relationship between embryos evolution environment and ecology discuss the dilemma for homology of the fact that development evolves deal with the importance of understanding how embryos measure time and place both through development and evolutionarily through heterochrony and heterotrophy and set out the principles and processes that underlie evolutionary developmental biology With over one hundred illustrations and photographs extensive cross referencing between chapters and boxes for ancillary material this latest edition will be of immense interest to graduate and advanced undergraduate students in cell developmental and molecular biology and in zoology evolution ecology and entomology in fact anyone with an interest in this new and increasingly important and interdisciplinary field which unifies biology

Homology, Genes, and Evolutionary Innovation Günter P. Wagner, 2014-04-13 A major synthesis of homology written by a top researcher in the field Homology a similar trait shared by different species and derived from common ancestry such as a seal's fin and a bird's wing is one of the most fundamental yet challenging concepts in evolutionary biology This groundbreaking book provides the first mechanistically based theory of what homology is and how it arises in evolution Günter Wagner one of the preeminent researchers in the field argues that homology or character identity can be explained through the historical continuity of character identity networks that is the gene regulatory networks that enable differential gene expression He shows how character identity is independent of the form and function of the character itself because the same network can activate different effector genes and thus control the development of different shapes sizes and qualities of the character Demonstrating how this theoretical model can provide a foundation for understanding the evolutionary origin of novel characters Wagner applies it to the origin and evolution of specific systems such as cell types skin hair and feathers limbs and digits and flowers The first major synthesis of homology to be published in decades **Homology Genes and Evolutionary Innovation** reveals how a mechanistically based theory can serve as a unifying concept for any branch of science concerned with the structure and development of organisms and how it can help explain major transitions in evolution and broad patterns of biological diversity

Advances in Developmental Biology Paul Wassarman, 1996-06-25 Volume 4 of *Advances in Developmental Biology and Biochemistry* consists of five chapters that review specific aspects of fly and mammalian development In Chapter 1 Y Mishina and R Behringer discuss various aspects of Müllerian inhibiting substance MIS in mammals from a brief history of its discovery to recent studies of the MIS gene in transgenic and knock out animals In Chapter 2 C Rushlow and S Roth discuss the role of the dpp group genes in dorsoventral patterning of the *Drosophila* embryo In Chapter 3 M Yip and H Lipshitz discuss the terminal asegmental termini gene hierarchy of *Drosophila* and the genetic control of tissue specification and morphogenesis In Chapter 4 R Bachvarova

discusses induction of mesoderm and the origin of anterior posterior polarity in the mouse embryo using the frog embryo as a paradigm In Chapter 5 P Vogt discusses human Y chromosome function in male germ cell development
