Non-Invasive Characterization of Liver Disease Markus Karlsson,2019-12-13 There is a large and unmet need for diagnostic tool that can be used to characterize chronic liver diseases CLD In the earlier stages of CLD much of the diagnostics involves performing biopsies which are evaluated by a histopathologist for the presence of e g fat iron inflammation and fibrosis Performing biopsies however have two downsides i biopsies are invasive and carries a small but non negligible risk for serious complications ii biopsies only represents a tiny portion of the liver and are thus prone to sampling error Moreover in the later stages of CLD when the disease has progressed far enough the ability of the liver to perform its basic function will be compromised In this stage there is a need for better methods for accurately measuring liver function Additionally measures of liver function can also be used when developing new drugs as biomarkers for drug induced liver injury DILI which is a serious drug safety issue Magnetic resonance imaging MRI is a non invasive

medical imaging modality which have shown much promise with regards to characterizing liver disease in all of the abovementioned aspects The aim of this PhD project was to develop and validate MR based methods that can be used to non invasively characterize liver disease Paper I investigated if R2 mapping a MR method for measuring liver iron content can be confounded by liver fat The results show fat does affect R2 The conclusion was therefore that fat must be taken into account when measuring small amounts of liver iron as a small increase in R2 could be due to either small amounts of iron or large amounts of fat Paper II examined whether T1 mapping which is another MR method can be used for staging liver fibrosis The results of previous research have been mixed some studies have been very promising whereas other studies have been less promising Unfortunately the results in Paper II belongs to the less promising studies Paper III focused on measuring liver function by dynamic contrast enhanced MRI DCEMRI using a liver specific contrast agent which is taken up the hepatocytes and excreted to the bile The purpose of the paper was to extend and validate a method for estimating uptake and efflux rates of the contrast agent The method had previously only been applied in health volunteers Paper II showed that the method can be applied to CLD patients and that the uptake of the contrast agent is lower in patients with advanced fibrosis Paper IV also used studied liver function with DCE MRI in patients with primary sclerosing cholangitis PSC PSC is a CLD where the bile ducts are attacked by the immune system When diagnosing PSC patients it is common to use magnetic resonance cholangiopancreatography MRCP which is a method for imaging the bile ducts Paper IV examined if there was any correlation between number and severity of the morphological changes seen on MRCP and measures of liver function derived using DCE MRI However the results showed no such correlation The conclusion was that the results indicates that MRCP should not be used to predict parenchymal function Paper V developed a method for translating DCE MRI liver function parameters from rats to humans This translation could be of value when developing new drugs as a tool for predicting which drugs might cause drug induced liver injury In summary this thesis has shown that multimodal quantitative MR has a bright future for characterizing liver disease from a range of different aspects

Quantitative Magnetic Resonance Imaging Nicole Seiberlich,Vikas Gulani,Adrienne Campbell-Washburn,Steven Sourbron,Mariya Ivanova Doneva,Fernando Calamante,Houchun Harry Hu,2020-11-18 Quantitative Magnetic Resonance Imaging is a go to reference for methods and applications of quantitative magnetic resonance imaging with specific sections on Relaxometry Perfusion and Diffusion Each section will start with an explanation of the basic techniques for mapping the tissue property in question including a description of the challenges that arise when using these basic approaches For properties which can be measured in multiple ways each of these basic methods will be described in separate chapters Following the basics a chapter in each section presents more advanced and recently proposed techniques for quantitative tissue property mapping with a concluding chapter on clinical applications The reader will learn The basic physics behind tissue property mapping How to implement basic pulse sequences for the quantitative measurement of tissue properties The strengths and limitations to the basic and

more rapid methods for mapping the magnetic relaxation properties T1 T2 and T2 The pros and cons for different approaches to mapping perfusion The methods of Diffusion weighted imaging and how this approach can be used to generate diffusion tensor maps and more complex representations of diffusion How flow magneto electric tissue property fat fraction exchange elastography and temperature mapping are performed How fast imaging approaches including parallel imaging compressed sensing and Magnetic Resonance Fingerprinting can be used to accelerate or improve tissue property mapping schemes How tissue property mapping is used clinically in different organs Structured to cater for MRI researchers and graduate students with a wide variety of backgrounds Explains basic methods for quantitatively measuring tissue properties with MRI including T1 T2 perfusion diffusion fat and iron fraction elastography flow susceptibility enabling the implementation of pulse sequences to perform measurements Shows the limitations of the techniques and explains the challenges to the clinical adoption of these traditional methods presenting the latest research in rapid quantitative imaging which has the possibility to tackle these challenges Each section contains a chapter explaining the basics of novel ideas for quantitative mapping such as compressed sensing and Magnetic Resonance Fingerprinting based approaches
