Megakaryocyte Biology And Precursors In Vitro Cloning And Cellular Properties:

Megakaryocyte Biology and Precursors Bruce L. Evatt, Richard Frank Levine, Neil Thomas Williams, 1981

Biochemical Pharmacology of Blood and Bloodforming Organs James W. Fisher, 2012-12-06 The subject of this volume is to review chemical agents which affect blood and blood forming organs. Significant advances made over the past several years in the purification of several hematopoietic growth factors such as erythropoietin and colony stimulating factor the availability of several other growth factors such as the interleukins which are important in regulating the production of red blood cells leukocytes megakaryocytes and platelets are discussed. Numerous toxic chemical substances are being produced in our environment which people are exposed to daily causing a suppression of erythropoiesis myelopoiesis and megakaryocytopoiesis. Attempts to evaluate both the therapeutic role of some of the newer growth factors such as erythropoietin in the anemia of end stage disease as well as colony stimulating factors in some hematopoietic abnormalities are also covered in this volume. In addition numerous chemical factors in our environment which suppress major hematopoietic lineages stimulated by erythropoietin macrophage colony stimulating factor granulocyte colony stimulating factor interleukin 1 alpha 1 beta 2 3 4 5 6 and 7 are also included. In addition chapters on the use of erythropoietin in the treatment of anemia of end stage renal disease can provide the practicing hematologist and nephrologist with updated information on the use of erythropoietin for this disease. The book includes chapters on the fundamental control of hematopoiesis and other mechanisms of action of erythropoietin and finally an up to date overview of the chemotherapy of leukemia. This book will prove useful to investigators in the fields of pharmacology physiology nephrology urology hematology pathology endocrinology biochemistry and molecular and cell biology.

Thrombopoiesis and

Thrombopoietins David Kuter, Pamela Hunt, William P. Sheridan, Dorothea Zucker-Franklin, 2012-12-06 David Kuter and a host of leading international researchers summarize in one volume all the knowledge of thrombopoietins TPO available today. The distinguished experts review the history of the search to discover TPO describe the molecular and biological characteristics of this new molecule and present the results of the preclinical animal experiments that will guide clinical use of this new hormone. Along the way they provide the most recent and comprehensive guide to the biology of megakaryocytes and platelets.

Biochemistry of Platelets David Phillips, 2012-12-02 Biochemistry of Platelets is a comprehensive review of the biochemistry of platelets with emphasis on the molecular basis for the various biological processes in which they participate. Topics range from stimulus response coupling mechanisms to platelet contractile proteins platelet membrane glycoproteins and storage organelles in platelets and megakaryocytes. The expression and function of adhesive proteins on the platelet surface is also discussed. Comprised of 12 chapters this book begins with a description of the morphological and metabolic responses to agonists as well as the involvement of certain processes in the coupling of agonist receptor interactions to platelet responses. The following chapter deals with platelet arachidonate metabolism and platelet activating

factor focusing on the release of arachidonate from platelet lipid stores pathways of platelet arachidonate metabolism and effects of arachidonate metabolites and inhibition of platelet arachidonate metabolism by aspirin The structure function and modification in disease of platelet membrane glycoproteins are then discussed along with prothrombin activation on platelets and platelet regulation of thrombus formation Secreted platelet proteins as markers for pathological disorders are also considered This monograph is intended as a reference for investigators involved in platelet research as well as a source of information for those working in other areas of biological investigation

Molecular Biology of Hemopoiesis Mehdi Tavassoli,2012-12-06 Perhaps no scientific field in recent years has gained in techniques and applications as much as molecular biology and it is certainly no exaggeration to say that among all the applications of molecular biology hematology in general and hemopoiesis in particular have benefited most Owing to the applications of molecular biology we now live in a golden era of hemopoiesis Our understanding of the intricate regulatory system in hemopoiesis has vastly expanded The potential for future exploration is ever expanding and finally the possibility of gene manipulation has provided the promise of fundamental treatment and cure of many genetic disorders involving hemopoietic cells In the ambiance of this rapidly moving scientific era the necessity for review of what is being accomplished and where the technical potential is taking us needs no argument This volume presents the proceedings of the third annual symposium on the Molecular Biology of Hemopoiesis held in the Rye Town Hilton New York November 6 and 7 1987 under the auspices of New York Medical College Valhalla New York The fact that this was the third regular symposium covering this area in itself testifies to a need for exchange of the rapidly developing knowledge in this area But this third symposium also coincided with the centennial of the National Institutes of Health and consequently the symposium was dedicated to this festive occasion

Current Methodology in Experimental Hematology S. J. Baum,1985-02-21 **Radiopathology of Organs and Tissues** Eberhard

Scherer,Christian Streffer,Klaus-Rüdiger Trott,2012-12-06 The biologic effects of radiation on normal tissues and tumors represent a complex area for investigation These effects are of far reaching consequence to the diagnostic radiologist and the radiation oncologist having a significant impact not only in concepts relative to radiation protection but also in concepts relative to tumor biology and its response to radiation injury The volume edited by SCHERER STREFFER and TROTT represents an extension of basic radiation biology data into the effects of radiation in producing pathology in organs and tissues The data presented by the multiple authors involved in this text cover essentially all tissues in the body with specific definition of radiopathology changes and their impact on clinical care of the patient This volume represents an important and significant contribution toward a better understanding of these effects and the pathology produced by radiations L W BRADY H P HEILMANN F HEUCK M W DONNER Philadelphia Hamburg Stuttgart Baltimore Preface This book represents an attempt to describe the clinical radiobiology of complications arising in different organs after radiotherapy of cancer patients Since by their very nature malignant tumors infiltrate the organ in which they have arisen and the neighboring tissues

curative radiotherapy requires the planned irradiation of considerable amounts of healthy but potentially or microscopically involved normal tissues and organs with the full target dose This may lead to early or late normal tissue radiation injury

Megakaryocyte Development and Function Richard Frank Levine,1986 **Cloning** Stephen D. Fairbanks,2004 The terms recombinant DNA technology DNA cloning molecular cloning or gene cloning all refer to the same process the transfer of a DNA fragment of interest from one organism to a self replicating genetic element such as a bacterial plasmid The DNA of interest can then be propagated in a foreign host cell This technology has been around since the 1970s and it has become a common practice in molecular biology labs today Reproductive cloning is a technology used to generate an animal that has the same nuclear DNA as another currently or previously existing animal Dolly was created by reproductive cloning technology In a process called somatic cell nuclear transfer SCNT scientists transfer genetic material from the nucleus of a donor adult cell to an egg whose nucleus and thus its genetic material has been removed The reconstructed egg containing the DNA from a donor cell must be treated with chemicals or electric current in order to stimulate cell division Once the cloned embryo reaches a suitable stage it is transferred to the uterus of a female host where it continues to develop until birth Therapeutic cloning also called embryo cloning is the production of human embryos for use in research The goal of this process is not to create cloned human beings but rather to harvest stem cells that can be used to study human development and to treat disease Stem cells are important to biomedical researchers because they can be used to generate virtually any type of specialised cell in the human body This new book presents an up to date Chronology of Cloning along with current and selected abstracts dealing with cloning as well as a guide to books on the topic Access to the abstract and books sections is provided by title subject and author indexes

NIH Publication ,1983 *Platelet Kinetics and Imaging: Techniques and normal platelet kinetics* ,1985 **Molecular Biology and Differentiation of Megakaryocytes** Janine Breton-Gorius,1990 This work assembles the contributions of authorities from many areas of cell biology in order to provide a critical account of recent developments in the field that have led to the considerable expansion of megakaryocyte research Technological advances that have opened up new vistas in the study of megakaryocytes defining their roles in platelet production hematopoietic regulation and a variety of platelet and vascular disorders are also covered Divided into sections on megakaryocyte maturation regulation and pathology the book also features discussion summaries that clarify and expand the material covered in the individual chapters

Basic Histology Luiz Carlos Uchôa Junqueira, José Carneiro, Robert O. Kelley, 1998 This is the leading textbook for medical histology and microscopic anatomy courses. It features an updated description of the structure and function of cells and the function and specialization of the four tissue groups: epithelial, connective, adipose, and nerve. Chapters on the cytoplasm and cell nucleus are updated to include the most recent discoveries on cell biology. It also describes the cellular function of each organ. Clinical correlations are highlighted throughout the book.
