Structure Determination Werner Massa, 2013-03-09 To solve a crystal structure means to determine the precise spatial arrangements of all of the atoms in a chemical compound in the crystalline state This knowledge gives a chemist access to a large range of information including connectivity conformation and accurate bond lengths and angles In addition it implies the stoichiometry the density the symmetry and the three dimensional packing of the atoms in the solid Since interatomic distances are in the region of 100 300 pm or 1 3 Å 1 microscopy using visible light wavelength ca 300 700 nm is not applicable Fig 11 In 1912 Max von Laue showed that crystals are based on a three dimensional lattice which scatters radiation with a wavelength in the vicinity of interatomic distances i e X rays with 50 300 pm The process by which this radiation without changing its wave length is converted through interference by the lattice to a vast number of observable reflections with characteristic directions in space is called X ray diffraction The method by which the directions and the intensities of these reflections are measured and the ordering of the atoms in the crystal deduced from them is called X ray structure analysis The following chapter deals with the lattice properties of crystals the starting point for the explanation of these interference phenomena Interatomic distances Crystals **Ternary Alloys Based on III-V Semiconductors** Vasylyshyn, 2017-09-29

Crystal Growth Bibliography A. M. Keesee, 2012-11-29 Man's first experience with the ordered state of matter to which we now apply the generic term crystals came about when he found specimens of some of the natural crystalline mineral substances that are relatively common in the surface and near surface areas of the earth's crust His first widespread use of these natural materials in which their crystalline nature was of importance was undoubtedly in fabricating jewelry and otherwise adorning his weapons tools and household items Both the Old and New Testaments of the Bible document the use of crystalline gems and the Romans are credited with first employing diamonds a metastable crystalline form of carbon in jewelry Various civilizations appear to have ascribed magical powers to some natural crystals and they are known to have been widely accepted in Europe as having medicinal properties during the Middle Ages Given early man's appreciation of the symmetry and beauty of natural crystals it is not surprising that his earliest interest in working with these materials appears to have been directed toward techniques for duplicating or manufacturing these substances that were so highly valued as gems Although the exact beginning of the science that we now know as crystal growth cannot be precisely specified we do know that Robert Boyle had attempted to grow crystals that could be used as gems prior to 1672 Much later
