

The Incidence, Severity and Occurrence of Four Viruses Infecting Pepper (*Capsicum spp.*) in the Southern Guinea Savannah Agro-ecological Zone of Nigeria

Taiye Hussein ALIYU

Summary

The incidence, severity and occurrence of four viruses infecting pepper were determined in Kwara State, Nigeria. A disease survey and antigen-coated plate enzyme-linked immunosorbent assay (ACP-ELISA) were the tools deployed to achieve these objectives. The survey indicated the highest virus incidence (97%) in four locations, and the lowest incidence (16%) in three locations, with variations in severity scores. The ELISA result indicated the occurrence of all four viruses with the highest percentage occurrence of virus in the samples as follows: Pepper vein mottle virus (36.3%), Blackeye cowpea mosaic virus (16.2%), Cowpea aphid borne mosaic virus (7.4%), and Cucumber mosaic virus in the locations (4.8%). The results indicate the prevalence of these viruses on pepper in the Southern Guinea savannah agro-ecological zone and therefore the need for constant studies to detect other viruses that limit pepper production.
