Recent Advances In Nervous System Toxicology:

Recent Advances in Nervous System Toxicology Corrado L. Galli, Luigi Manzo, Peter S. Spencer, 2012-12-06 This volume addresses some facets of the adverse actions of chemical agents on the central and peripheral nervous systems in developing and mature states Some of the effects of these chemicals are short lasting and rapidly reversible others especially those that cause structural damage to the nervous system may result in permanent damage to the organism The nervous system has several levels of vulnerability to toxic substances Some substances perturb ion channels or synaptic mechanisms required for the orderly transfer of electrochemical information within the nervous system Others disrupt sites required for the maintenance of cellular integrity and these variably result in degenerative responses of neurons and myelinating cells Further sites of vulnerability include the delicate neural vasculature and neurohumoral mechanisms responsible for physiological homeostasis The science of neurotoxicology inevitably is a multidisciplinary endeavor with contributions from biochemistry physiology morphology and behavior to name a few The challenge is to apply appropriate techniques to investigate neurotoxic phenomena The first logical step in this analysis is to determine from the point of view of the nervous system the nature of the exposure Is the chemical a single or multiple entity is it metabolized how does it gain access to neural tissue Once these factors are understood changes induced by the exposure can be described at various levels from the biochemical to the behavioral [Recent advances in fish toxicology](#) Richard A. Communication Jacopo Lamanna, Mattia Ferro, Emanuele Cocucci, 2023-11-10 Synapses represent a unique neuronal compartment specialized in communication The morpho functional investigation of the synapse has always been hindered by its tiny size and high density of molecular elements but specific technological and methodological advances helped us to reduce these limitations As the matter of fact in recent years we have witnessed the continuous development of new methods allowing measuring and controlling synaptic activation both in vitro and in vivo These include new genetically encoded sensors of synaptic exo endocytosis but also engineered synaptic proteins able to inhibit the release of neurotransmitters Furthermore new promising tools allow changing the functional properties of synapses in a plasticity like manner All these methodological advances are likely to generate unprecedented knowledge about the dynamics of synaptic transmission and plasticity at several levels of the nervous system Nevertheless in most cases the implementation of these new methods remains technically demanding likely due to the high complexity of their operating principle Hence it would be worth refining and potentiating these tools in order to extend the range of experimental settings for their application Reproductive Toxicology Robert W.
