Brunner, 2012-12-06 With very few exceptions geodetic measurements use electro magnetic radiation in order to measure directions distances time delays and Doppler frequency shifts to name the main terrestrial and space observables Depending on the wavelength of the radiation and the purpose of the measurements the following parameters of the electromagnetic wave are measured amplitude phase angle of arrival polarisation and frequency Accurate corrections have to be applied to the measurements in order to take into account the effects of the intervening medium between transmitter and receiver The known solutions use atmospheric models special observation programs remote sensing techniques and instrumental methods It has been shown that the effects of the earth's atmospheric envelope present a fundamental limitation to the accuracy and precision of geodetic measurements This applies equally to terrestrial and space applications Instrumental accuracies are already below the atmospherically induced limitations and thus the accuracy demands on the geodetic refraction solutions are entering a new magnitude zone This monograph is primarily devoted to the properties of the atmospheric effects on various geodetic measurements and to their evaluation Ten review papers cover the most pressing aspects of the atmospheric effects on geodetic measurement These state of the art papers were written by eminent specialists in their respective research fields      **Analysis of Refraction Influences in Geodesy Using Image Processing and Turbulence Models** Philipp Flach, 2001      *Third International Symposium on the North American Vertical Datum*, 1985      *Refractional Influences in Astrometry and Geodesy* E. Gough, 2012-12-06 D O GOUGH Institute of Astronomy Madingley Road Cambridge U K IAU Colloquium 66 on Problems of Solar and Stellar Oscillations was held at the Crimean Astrophysical Observatory U S S R on 15 September 1981 The principal purpose of the colloquium was to study the low amplitude oscillations of the Sun and to a lesser extent to consider similar oscillations of other stars Much of the emphasis of the discussions was on the diagnostic value of the oscillations In the last few years we have become aware that the frequencies of the five minute modes of high degree which constitute the major component of the oscillations discovered twenty years ago by Evans and Michaud can be used to put quite tight bounds on the stratification of the solar convection zone These permit a calibration of solar models computed from so called standard evolution theory Modes of low degree penetrate beneath the convection zone to the core of the Sun and can in principle test the evolution theory Therefore there was considerable interest in the reports of the latest observations of such modes Broadly speaking those observations confirm the calibration by the high degree modes but there remain some systematic discrepancies that demand some revision of the theory Besides the gross aspects of evolution theory there are also more intricate details to be understood      **The Role of VLBI in Astrophysics, Astrometry and Geodesy** Franco Mantovani, Andrzej Kus, 2005-12-31 A masterly survey of the last 13 years of Very Long Baseline Interferometry reviewed in light of the most advanced astronomical observations Topics covered include Nonthermal emission from extragalactic radio sources Principles of synchrotron emission in relation to astrophysics Theory of relativistic jets Young powerful radio sources and their evolution Scintillation in extragalactic radio sources Radio and optical interferometry Radio polarimetry Unified schemes Deep fields Tropospheric and ionospheric phase calibration Supernovae VLBI for geodesy and geodynamics      Proceedings of Symposium No. 5, Geodetic Applications of Radio Interferometry Symposium Geodetic Applications of Radio Interferometry (5, 1982, Tokyo), William Eugene Carter, 1982
