Guided Regeneration of the Human Skin Erika Nyman, 2015-03-17 Every day and in all parts of the world humans experience different grades of wounding and tissue loss of the skin thus initiating one of the most complex biological processes Acute and chronic wounds as well as the additional problem of skin scarring involve not only great suffering for the patient but also extensive health care costs for the society Although the wound healing process is a wellstudied field much knowledge must be gained to unlock the door to regenerative pathways in humans Epidermis heals by complete regeneration but dermal and full thickness injuries heal with fibrosis and scar formation In Papers I and II we studied whether dermal scarring could be turned into regeneration by using two different types of threedimensional dermal scaffolds In Paper I we studied a solid scaffold made of poly urethane urea initially in vitro then followed by in vivo studies In Paper II we intradermally injected a liquid three dimensional scaffold consisting of porous gelatin spheres in human healthy volunteers Both materials showed ingrowth of functional fibroblasts and blood vessels and appeared to stimulate regeneration while slowly degrading This finding could be of significant clinical importance for example in burn wound care or after cancer surgery In Papers III and IV we wanted to study the effects of amniotic fluid and hyaluronic acid on adult wound healing because early fetal wounds re epithelialize rapidly and naturally heal dermis by regeneration without the need of a dermal scaffold Amniotic fluid naturally rich in hyaluronic acid induced an accelerated reepithelialization of adult human wounds in vitro and hyaluronic acid seemed to be important for this effect Stimulation with exogenous hyaluronic acid in vivo induced accelerated re epithelialization and an altered protein expression in healthy human volunteers The inflammatory phase of wound healing as measured by tissue viability imaging was not affected by hyaluronic acid Elucidating the effects of amniotic fluid and hyaluronic acid on the wound healing process may allow improved treatment of wounds with impaired healing Studies on finding new dermal scaffolds and studies on the positive effect of amniotic fluid or hyaluronic acid on the wound healing process are two different ways of gaining insight that may lead to regeneration and improved wound healing for the patient

Stocum,2014-07-08 Regeneration the homeostatic ability to maintain tissue structure in the face of normal cell turnover or loss of tissue damaged by trauma or disease is an essential developmental process that continues throughout life As recently as a decade ago any serious discussion of the possibility of regeneration becoming a practical medical tool in the near future had the air of science fiction or over optimistic speculation The term regenerative medicine was certainly on many lips but few actually expected to soon see it applied in a clinical setting A tidal wave of discovery has changed that and investigating the cellular mechanisms of natural regeneration has become one of the hottest topics in developmental biology and biomedicine in general Many researchers entering the field find that the regeneration literature is still quite diffuse perhaps owing to the disparate biological systems that have been the object of study including hydra planaria newts axolotls and more recently several mouse strains The volume editors believe that an attempt to organize or systematize the literature is long overdue In this volume respected experts highlight the latest findings in vertebrate including mammals wound healing and regeneration They present eleven reviews that cover a wide range of topics from wound repair and its relationship to regeneration through systems including lenticular neural and musculoskeletal tissues and limbs to epigenetics and the role of the cell cycle Nuclear reprogramming and cellular plasticity which open the door for potential regenerative medical therapies for injury and degenerative disease are recurring themes throughout the book We are all now part of the regeneration revolution Physiology Ernest S. Chang,Martin Thiel,2015-02-27 The Crustacea is one of the dominant invertebrate groups displaying staggering diversity in form and function and spanning the full spectrum of Earth s environments Crustaceans are increasingly used as model organisms in all fields of biology as few other taxa exhibit such a variety of body shapes and adaptations to particular habitats and environmental conditions Physiology is the fourth volume in The Natural History of the Crustacea series and the first book in over twenty five years to provide an overview of the comparative physiology of crustaceans An understanding of physiology is crucial to a comprehension of the biology of this fascinating invertebrate group Written by a group of internationally recognized experts studying a wide range of crustacean taxa and topics this volume synthesizes current research in a format that is accessible to a wide scientific audience
