Verstraete, 2006-04-11 1 2 Michel M VERSTRAETE and Martin BENISTON 1 Space Applications Institute EC Joint Research Centre Ispra Italy 2 Department of Geography University of Fribourg Switzerland This volume contains the proceedings of the workshop entitled Satellite Remote Sensing and Climate Simulations Synergies and Limitations that took place in Les Diablerets Switzerland September 20-24 1999 This international scientific conference aimed at addressing the current and potential role of satellite remote sensing in climate modeling with a particular focus on land surface processes and atmospheric aerosol characterization Global and regional circulation models incorporate our knowledge of the dynamics of the Earth's atmosphere They are used to predict the evolution of the weather and climate Mathematically this system is represented by a set of partial differential equations whose solution requires initial and boundary conditions Limitations in the accuracy and geographical distribution of these constraints and intrinsic mathematical sensitivity to these conditions do not allow the identification of a unique solution prediction Additional observations on the climate system are thus used to constrain the forecasts of the mathematical model to remain close to the observed state of the system Improving Regional Climate

Modeling of Impacts of Land Cover Changes on the Climate of the Marmara Region of Turkey Elif Sertel, Cankut Örmeci (Danışman.), İnşaat Fakültesi, 2008 This research investigated the usage of different remote sensing techniques to determine land cover change impacts of land cover change on summer climate of the Marmara Region the utilization of Landsat images in regional climate modeling and the accuracy of global land cover data sets used in climate modeling The Marmara Region which experienced significant land cover changes as a result of rapid industrialization and population

increase especially after 1980s was selected as my study area At the first stage of the research Landsat MSS images obtained between 1972 and 1975 and Landsat ETM images obtained between 2001 and 2005 were used to derive multi temporalland cover data of the Marmara Region First all images were atmospherically and radiometrically corrected to minimize contamination effects of atmospheric particles scattering and absorption effects due to the atmosphere and systematic errors Then geometric correction was performed for each image to eliminate geometric distortions correct errors in the relative positions of pixels and define images in a common coordinate system A new approach semivariograms was introduced to select appropriate band combinations for studying different land cover classes and determine the regions having significant land cover changes It was found that semivariograms can be used to determine spatial variations and significantly changed areas can be identified using the changes in semivariogram parameters Spatial profiles were created and examined to find out significant land cover changes in pilot regions and to determine the location and the size of land cover changes occurred in coastal zones Based on the information obtained from semivariograms and spatial profiles several pilot areas were created and classification employed separately for each area to minimize the spectral mixing of various classes such as barren crop and urban and increase the classification accuracy The classification results were aggregated to 1 km and change detection

Operationalization of Remote Sensing Solutions for Sustainable Forest Management Gintautas Mozgeris,Ivan Balenovic,2021-06-02 The great potential of remote sensing technologies for operational use in sustainable forest management is addressed in this book which is the reprint of papers published in the Remote Sensing Special Issue Operationalization of Remote Sensing Solutions for Sustainable Forest Management The studies come from three continents and cover multiple remote sensing systems including terrestrial mobile laser scanning unmanned aerial vehicles airborne laser scanning and satellite data acquisition and a diversity of data processing algorithms with a focus on machine learning approaches The focus of the studies ranges from identification and characterization of individual trees to deriving national or even continental level forest attributes and maps There are studies carefully describing exercises on the case study level and there are also studies introducing new methodologies for transdisciplinary remote sensing applications Even though most of the authors look forward to continuing their research nearly all studies introduced are ready for operational use or have already been implemented in practical forestry Natural Resources Management and Sustainable Livelihoods in the Mountainous Region Praveen Kumar Rai,Ashutosh Singh,Bobby Beingachhi,Suraj Kumar Singh,2024-07-27 This book explores the relationships between natural resources management sustainable livelihoods and integrated watershed management in the context of the mountainous region especially in the northeastern region of India The book also sheds light on the current state of regional issues identifies gaps in the existing practices and proposes future policies for effective conservation and sustainable development The environmental degradation in the northeastern region of India is basically attributed to the increasing biotic pressure on the fragile ecosystems in the absence of suitable investments and proper

management practices to enhance and conserve the natural resources Population growth and poverty on the one hand and the pressure of rising demand from wealth and consumerism on the other hand have been exerting powerful pressure on the ecosystems Natural resources planning and management and sustainable livelihoods through integrated watershed management is not just a technical challenge it is also a social challenge The book is a valuable resource for policymakers researchers practitioners and stakeholders involved in natural resource management sustainable development and watershed management in the Himalayan region *Geospatial Modeling for Environmental Management* Shruti

Wood, 2012-12-06 It is well known that the interactions between land surfaces and the atmosphere and the resulting exchanges in water and energy have a tremendous affect on climate The inadequate representation of land atmosphere interactions is a major weakness in current climate models and is providing the motivation for the HAPEX and ISLSCP experiments as well as the proposed Global Energy and Water Experiment GEWEX and the Earth Observing System EOS mission The inadequate representation reflects the recognition that the well known physical relationships which are well described at small scales result in different relationships when represented at the scales used in climate models Understanding this transition in the mathematical relationships with increased space time scales appears to be very difficult and has led to different approaches at one extreme the famous bucket model where the land surface is a simple one layer storage without vegetation the other extreme may be Sellers Simple Biosphere Model Sib where one big leaf covers the climate model grid Given the heterogeneous nature of landforms soils and vegetation within a climate model grid the development of new land surface parameterizations and their verification through large scale experiments is perceived to be a challenging area of research for the hydrology and meteorology communities This book evolved from a workshop held at

Princeton University to explore the status of land surface parameterizations within climate models and how observational data can be used to assess these parameterizations and improve models

Interdisciplinary Pedagogy for STEM Reneta D. Lansiquot, 2016-07-09 This book focuses on constructivist theory and collaborative interdisciplinary studies showing how constructivist theory complements interdisciplinary studies Constructivist theory stresses how learners construct new ideas and concepts while the interdisciplinary method requires that learners approach complex problems from multiple perspectives The author uses the New York City College of Technology as a model to demonstrate how learning can be embedded in complex realistic and relevant environments As a result students learn to consider significant issues from a variety of viewpoints and thus negotiate their social landscape In approaching problems that they recognize as meaningful they take ownership of their learning and become increasingly self aware This scholarly book makes a theoretical contribution to its field while also offering a practical real world example of how to successfully integrate a curriculum

Scientific and Technical Aerospace Reports, 1994 *Recent Advances in the Modeling of Hydrologic Systems* D.S Bowles, P. Enda O'Connell, 2012-12-06 Modeling of the rainfall runoff

process is of both scientific and practical significance. Many of the currently used mathematical models of hydrologic systems were developed a generation ago. Much of the effort since then has focused on refining these models rather than on developing new models based on improved scientific understanding. In the past few years, however, a renewed effort has been made to improve both our fundamental understanding of hydrologic processes and to exploit technological advances in computing and remote sensing. It is against this background that the NATO Advanced Study Institute on Recent Advances in the Modeling of Hydrologic Systems was organized. The idea for holding a NATO ASI on this topic grew out of an informal discussion between one of the co-directors and Professor Francisco Nunes Correia at a previous NATO ASI held at Tucson, Arizona, in 1985. The Special Program Panel on Global Transport Mechanisms in the Geo Sciences of the NATO Scientific Affairs Division agreed to sponsor the ASI and an organizing committee was formed. The committee comprised the co-directors Professor David S. Bowles, U.S.A. and Professor P. Enda O'Connell, U.K. and Professor Francisco Nunes Correia, Portugal. Dr. Donn G. DeCoursey, U.S.A. and Professor Ezio Todini, Italy.

Studies Of Cloud, Convection And Precipitation Processes Using Satellite Observations William B. Rossow, George Tselioudis, Zhengzhao Johnny Luo, 2022-10-26. Clouds, convection, and precipitation processes are central components of Earth's weather and climate. They are produced by atmospheric motions across a very wide range of space-time scales, from local weather to long-term global climate variation. They feedback on these motions by perturbing the heating-cooling that drives the atmospheric circulation. These processes also perturb the oceanic circulation and land surface properties that affect the atmospheric circulation. Because of the coupling of the atmosphere-ocean-land system across all scales by cloud, convection, and precipitation processes, studying their behaviors requires measurements in space-time variations across all these scales simultaneously. Satellite constellations with global coverage and high time resolution offer the ideal platforms for such observations. This book summarizes some of the latest research using combinations of various satellite observations to study these processes and to evaluate their representations in global weather and climate models. Included with this publication are downloadable electronic slides and accompanying notes of each lecture for students, teachers, and public speakers around the world to be better able to understand cloud, convection, and precipitation processes.
