

SECOND CONFERENCE ON TALL BUILDINGS IN SEISMIC REGIONS

MAY 16 AND 17, 1991, LOS ANGELES, CALIFORNIA, USA

D. R. Brunsdon*

INTRODUCTION

This article reviews the Second Conference on Tall Buildings in Seismic Regions held in Los Angeles on May 16 and 17, 1991. This conference was organised jointly by The Los Angeles Tall Buildings Structural Design Council and The Council on Tall Buildings and Urban Habitat.

Approximately 150 delegates from nine countries attended the conference, including the writer.

The stated purpose of the conference was to overview current and future trends in design and construction of tall buildings for seismic and wind effects.

The following papers were prepared for and presented at the conference by New Zealand engineers:

"Design and Construction of the National Bank Centre, Auckland"
Kevin C.F. Spring and G.K. Sidwell
(Rankine and Hill Limited).

"Implications of the 1989 Newcastle Earthquake on the Design and Construction of Tall Buildings in Australia"
David Brunsdon and James Forbes (Irwin Johnston and Partners, Sydney).

This review comments briefly under various headings on items presented or discussed at the conference that are considered to be of interest, based on the sessions attended by the writer.

BUILDING APPROVAL PROCESSES

The first plenary session of the conference featured Los Angeles-based property developers and consultants reviewing the various steps involved in obtaining authorities approvals for a multi-storey project in Los Angeles and the changes to those steps that have occurred over the last five years. The main point of interest in this presentation was the increasingly political nature of the approvals process in Los Angeles, and the implications for other cities.

Key changes in the approvals process include the following:

- The obligation to satisfy onerous new State and Federal requirements in addition to the established City planning conditions. One such recent requirement is the need for an Environmental Impact Report for virtually every land development project, including those in the centre of the city.
- Elected city officials having greater input in and control over the process, with correspondingly less involvement from employed officers. Many of these elected officials have won office on "no growth" platforms. In addition, some Councils now require a unanimous vote in favour of a project before approval is given, rather than the former majority decision.
- Associated with the involvement of elected officials has been the trend towards the imposition of additional "city amenity fees" on a project-by-project (i.e. ad hoc) basis.

As an indication of the impact of these changes, it was estimated that a project which took nine months to gain authorities approval in 1987 would currently require at least three and possibly five years for the corresponding approval. The consequential increase in overall project costs has represented another negative influence on a recessionary real estate market.

LATERAL LOAD RESISTING SYSTEMS FOR TALL BUILDINGS

Various case studies of recently designed tall buildings were presented, and each featured one of the three following lateral load resisting systems:

- moment resisting steel frames,
- moment resisting ductile concrete frames,
- reinforced concrete shear walls.

A recent variation to the conventional ductile beam and column frame is the development of a modular virescedel subframe for resisting lateral loads. This system has been developed in response to the many architectural constraints in the lower levels of buildings where a large proportion of perimeter columns cannot pass without

Gioncu,1995-10-12 This book forms the proceedings of the International Workshop organised by the European Convention for Constructional Steelwork held in Timisoara Romania in June 1994 It presents the latest progress in theoretical and experimental research on the behaviour of steel structures in seismic areas taking into account the basic problems of local and global ductility codification design and applications It relates strongly to the activities on international codification taking place in Europe *The Loma Prieta, California, Earthquake of October 17, 1989--building Structures* ,1998

International Handbook of Earthquake Engineering Mario Paz,2012-12-06 The subject of earthquake engineering has been the focus of my teaching and research for many years Thus when Mario Paz the editor of this handbook asked me to write a Foreword I was interested and honored by his request Worldwide people are beginning to understand the severity of the danger to present and future generations caused by the destruction of the environment Earthquakes pose a similar threat thus the proper use of methods for earthquake resistant design and construction is vitally important for countries that are at high risk of being subjected to strong motion earthquakes Most seismic activity is the result of tectonic earthquakes Tectonic

earthquakes are very special events in that although they occur frequently their probability of becoming natural hazards for a specific urban area is very small When a severe earthquake does occur near an urban area however its consequences are very large in terms of structural destruction and human suffering

With the gradual development of rules for designing against instability the idea emerged in London in 1974 to hold an International Colloquium treating every aspect of structural instability of steel structures There have been 17 International Colloquia Stability Sessions around the world starting with the first one in Paris in 1972 until with the last one in Nagoya in 1997 In Nagoya it was decided to continue the series of travelling colloquia by

launching the Sixth Colloquium in September 1999 with the First Session to be held at the Politehnica University of Timi oara Rom nia which will be followed by another in the year 2000 at the Gediminas Technical University in Vilnius Lithuania a third one during SSRC s Year 2000 Annual Meeting in the US and a fourth one in Australia or New Zealand At present important research projects are in progress around the world like SAC Joint Venture Project in USA INCO COPERNICUS RECOS in Europe and others which are devoted to improve and develop new methods for the safety design of steel structures in seismic zones Special attention is paid in Europe USA and Japan to improve the design codes and detailing of seismic resistant steel structures This was the reason to organise the Session of Nagoya as Stability and Ductility of Steel Structures Colloquium Romania is also a strong seismic territory and therefore the topic of the Timi oara Session covered both stability and ductility problems The technical programme of the SDSS 99 Colloquium in Timi oara has been split into nine working sessions
