Application of Geographical Information Systems and Soft Computation Techniques in Water and Water Based Renewable Energy Problems Mrinmoy Majumder,2017-09-18 This book highlights the application of Geographical Information System GIS and nature based algorithms to solve the problems of water and water based renewable energy resources The irregularity in availability of resources and inefficiency in utilization of the available resources has reduced the potentiality of water and water based renewable energy resources In recent years various soft computation methods SCM along with GIS were adopted to solve critical problems The book collects various studies where many SCMs were used along with GIS to provide a solution for optimal utilization of natural resources for satisfying the basic needs of the population as well as fulfilling their burgeoning energy demands The articles depict innovative application of soft computation techniques to identify the root cause and to mitigate the uncertainty for optimal utilization of the available water resources The advantage of SCM and GIS were used to maximize the utilization of water resources under cost and time constraints in face of climatic abnormalities and effect of rapid urbanization **Scouring** H.N.C. Breusers,A.J. Raudkivi,2020-08-13 Information and technical data concerning scouring erosion caused by water fl in rivers and streams More specifically how certain structures exaggerate this natural process by restricting water flow causing constriction and local scour Material presented is from both field studies and laboratories **River Flow 2016** George Constantinescu,Marcelo Garcia,Dan Hanes,2016-06-22 Understanding and being able to predict fluvial processes is one of the biggest challenges for hydraulics and environmental engineers hydrologists and other scientists interested in preserving and restoring the diverse functions of

rivers The interactions among flow turbulence vegetation macroinvertebrates and other organisms as well as the transport and retention of particulate matter have important consequences on the ecological health of rivers Managing rivers in an ecologically friendly way is a major component of sustainable engineering design maintenance and restoration of ecological habitats To address these challenges a major focus of River Flow 2016 was to highlight the latest advances in experimental computational and theoretical approaches that can be used to deepen our understanding and capacity to predict flow and the associated fluid driven ecological processes anthropogenic influences sediment transport and morphodynamic processes River Flow 2016 was organized under the auspices of the Committee for Fluvial Hydraulics of the International Association for Hydro Environment Engineering and Research IAHR Since its first edition in 2002 the River Flow conference series has become the main international event focusing on river hydrodynamics sediment transport river engineering and restoration Some of the highlights of the 8th International Conference on Fluvial Hydraulics were to focus on inter disciplinary research involving among others ecological and biological aspects relevant to river flows and processes and to emphasize broader themes dealing with river sustainability River Flow 2016 contains the contributions presented during the regular sessions covering the main conference themes and the special sessions focusing on specific hot topics of river flow research and will be of interest to academics interested in hydraulics hydrology and environmental engineering

Water-resources Investigations Report ,1999 River Sedimentation Silke Wieprecht,Stefan Haun,Karolin Weber,Markus Noack,Kristina Terheiden,2016-11-30 Sediment dynamics in fluvial systems is of great ecological economic and human health related significance worldwide Appropriate management strategies are therefore needed to limit maintenance costs as well as minimize potential hazards to the aquatic and adjacent environments Human intervention ranging from nutrient pollutant release to physical modifications has a large impact on sediment quantity and quality and thus on river morphology as well as on ecological functioning Truly understanding sediment dynamics requires as a consequence a multidisciplinary approach River Sedimentation contains the peer reviewed scientific contributions presented at the 13th International Symposium on River Sedimentation ISRS 2016 Stuttgart Germany 19 22 September 2016 and includes recent accomplishments in theoretical developments numerical modelling experimental laboratory work field investigations and monitoring as well as management methodologies

microtopography integrated field observation and the random forest machine learning algorithm to assess watershed scale soil erosion assessment and developing the sediment delivery distributed SEDD model for sub watershed erosion risk prioritization In Part II the factors controlling soil erosion and vegetation degradation as influenced by topographic positions and climatic regions long term land use change and improper implementation of land management measures are well dealt with Part III presents different land management technologies that could reduce soil erosion at various spatial scales improve land productivity of marginal lands with soil microbes and reclaim degraded farmland using dredged reservoir sediments The final part relates livelihood diversification to climate vulnerability as well as the coping strategy to the adverse impacts of soil erosion through sustainable land management implementation which opens prospects for policy formulation The studies cover regions of Africa Europe North America and Asia being dominantly conducted under the framework of international scientific collaborations through employing a range techniques and scales from the laboratory to watershed scales We believe those unique features of the book could attract the interest of the wider scientific community worldwide
