Editors: D. Giardini, M. J. Jiménez and G. Grünthal

Scale 1:5 000 000

February 2000

1. INTRODUCTION
The European-Mediterranean Seismic Hazard Map (E-M-SHM) is a product of the SESAME (Seismicity of the Earth and Seismicity of the Mediterranean Area) project, which was initiated in 1992. The project was funded by the European Union and the Swiss Government. The main objective of the project was to develop a seismic hazard map for the European-Mediterranean region, which is one of the most seismically active regions in the world. The map is based on a comprehensive review of the seismicity of the region, and it provides a detailed assessment of the seismic hazard. The map is intended to be used for the purpose of seismic hazard assessment and for the design of seismic-resistant structures.

2. DATA SOURCES
The data used in the map are derived from a variety of sources, including seismic catalogs, geological maps, and geophysical data. The seismic catalogs include data from the European Seismological Commission (ESC), the International Seismological Centre (ISC), and the National Earthquake Information Center (NEIC). The geological maps are based on the work of the International Geological Correlation Program (IGCP). The geophysical data are derived from the work of the European Geophysical Society (EGS).

3. METHODOLOGY
The methodology used in the map is based on the principles of seismic hazard assessment. The first step is to identify the seismic sources in the region. This is done by analyzing the seismic catalogs and the geological maps. The next step is to estimate the seismic hazard for each source. This is done by using the principles of seismic hazard assessment. The final step is to combine the results of the individual source assessments to produce the overall seismic hazard map.

4. CONCLUSIONS
The E-M-SHM is a comprehensive assessment of the seismic hazard in the European-Mediterranean region. It provides a detailed assessment of the seismic hazard, and it is intended to be used for the purpose of seismic hazard assessment and for the design of seismic-resistant structures. The map is a valuable tool for the assessment of seismic hazard, and it is a product of the SESAME project, which was funded by the European Union and the Swiss Government.

Rifting and Sediments in the Red Sea and Arabian Gulf Regions Najeeb M.A. Rasul, Ian C.F. Stewart, 2024-05-08

Rifting and Sediments in the Red Sea and Arabian Gulf Regions is a unique text that covers a wide range of topics related to the tectonics and geology of the Red Sea and Arabian Persian Gulf region. This book is a collection of invited and peer reviewed chapters contributed by active researchers around the world. The topics covered in this book include tectonics, magmatism and lithology particularly in the Red Sea area. The book also delves into the sediments and evaporites of the Red Sea and Gulf. As the area around the Arabian Peninsula is prone to earthquakes, the seismic hazard estimated in the Red Sea region is also covered by several chapters. Each chapter presents new data and offers extensive lists of references for the reader to explore further. With the ongoing debates regarding the structure of the Red Sea, this book serves as an excellent resource for researchers and any individuals interested in the geology of these two unique seas.

Geller, 2012-12-06 What is the first thing that ordinary people for whom journalists are the proxy ask when they meet a seismologist It is certainly nothing technical like What was the stress drop of the last earthquake in the Imperial Valley It is a simple question which nevertheless summarizes the real demands that society has for seismology This question is Can you predict earthquakes Regrettably notwithstanding the feeling of omnipotence induced by modern technology the answer at present is the very opposite of Yes of course The primary motivation for the question Can you predict earthquakes is practical No other natural phenomenon has the tremendous destructive power of a large earthquake a power which is rivaled only by a large scale war An earthquake in a highly industrialized region is capable of adversely affecting the economy of the whole world for several years But another motivation is cognitive The aim of science is understanding nature and one of the best ways to show that we understand a phenomenon is the ability to make accurate predictions **Seismic Retrofitting:**

Learning from Vernacular Architecture Mariana R. Correia, Paulo B. how did local populations prepare their dwellings to face frequent earthquakes It was to respond to this gap in knowledge that the SEISMIC V research project was instigated and this interdisciplinary international publication was prepared The research revealed the existence of a local seismic culture in terms of reactive or preventive seismic resistant measures able to survive if properly maintained in areas with frequent earthquakes The fundamental contribution and aims of the publication were to enhance The disciplinary interest in vernacular architecture Its contribution to risk mitigation in responding to natural hazards To encourage academic and scientific research collaboration among different disciplines To contribute to the improvement of vernacular dwellings which half of the world s population still inhabits nowadays Fifty international researchers and experts presented case studies from Latin America the Mediterranean Eastern and Central Asia and the Himalayas region with reference to 20 countries i e Algeria Bolivia Bhutan Chile China Egypt El Salvador Greece Haiti Italy Japan Mexico Morocco Nepal Nicaragua Peru Romania Taiwan Turkey and a closer detailed analysis of Portugal This publication brings together 43 contributions with new perspectives on seismic retrofitting techniques and relevant data addressing vernacular architecture an amazing source of knowledge and to this day home to 4 billion people
