

The *Bureau of Mines* is concerned with seismic vibrations generated by mining operations; such vibrations may be a hazard to adjoining property as well as to the mining operations. The Bureau is also concerned with the interrelationships between seismology and rock mechanics and with applications of seismology to the design and maintenance of excavations.

The *National Aeronautics and Space Administration* (NASA) is concerned with seismology as a primary tool for investigating the internal structures of the moon and planets. Seismometers will be among the first scientific instruments landed on these bodies—and one has already been carried to the moon by the astronauts of the Apollo project. On the other hand, in the study of the moon and planets and their interrelationships with the earth, NASA scientists are vitally dependent upon information about earth structure gained through seismological research on the earth.

Results from seismic studies of the moon and planets are likely to be among the most scientifically revealing of the space program. NASA support for seismology has been on a narrow front, and restricted to only a few universities. The unique part that seismology plays in geophysics justifies increased and broader support for appropriate research, particularly in universities, into the seismological aspects of the physics of planetary interiors.

For the *Atomic Energy Commission* (AEC), seismology has grown in importance as the agency's functions have become increasingly extensive and intricate. From the days of the early nuclear explosions, it was recognized that those events would have certain unique features of great importance to seismological research. It was soon apparent that some of the close-in effects of nuclear detonations are seismic in nature, especially effects of underground explosions. Later, as political negotiations for a nuclear-test-ban treaty took place, the AEC became concerned with the seismological aspects of nuclear-test detection over long distances.

Recently, as potential applications for peaceful uses of nuclear explosives have become further developed, it has become clear that the seismic effects of underground detonations may be among the principle obstacles to their useful application. The construction of an underground reservoir, for example, would be carried out in some locations only if the seismic effects of the explosion could be reasonably well predicted and tolerated.

The possibility of release of stored tectonic strain by large underground nuclear detonations has recently been recognized. This problem is under active study. Its resolution is essential to the effective use of large-yield nuclear explosions for excavation and other beneficial purposes.

Perhaps the most important consideration of the AEC in this regard is the prediction of seismic effects at proposed sites for nuclear power stations. Nuclear energy is certain to assume increasing importance in the generation of electrical

power as time passes (see Figure 16). Because nuclear electricity-generating stations are permanent installations and because damage to them may endanger communities, they must be located and designed with appropriate safeguards. The likelihood of seismic damage to such an installation must be very small in order to avoid a disaster.

The increasing complexity of modern society resulting from scientific-technological development demands that man understand his environment with far greater thoroughness and detail than in the past if he is to live in harmony with it. Thus, the AEC must encourage studies of seismicity and engineering seismology if full use is to be made of nuclear power in the service of man.

The AEC supports a considerable number of programs related to seismology. It is likely that for public safety and other reasons the Commission will be required to expand these programs. Recent hearings concerning power-reactor sites in California and the possibility of triggering natural earthquakes in Nevada by tests of nuclear explosives are indicators of this trend. Many of the observational and research programs are carried out by university researchers, private companies, and consultants; others are contracted to such federal agencies as ESSA and the USGS. Many of the problems studied are central to seismology, and unique results and data have been obtained that appear to be of cardinal value in a broader seismological context. It may be ap-
