Atherton, J. Rudich, 2012-12-06 The tomato is commercially important throughout the world both for the fresh fruit market and the processed food industries It is grown in a wide range of climates in the field under protection in plastic greenhouses and in heated glasshouses Genetic physiological and pathological investigations frequently adopt the tomato plant as a convenient subject Hitherto much of the information on tomatoes has been fragmented tomatoes grown in the field and under protection have been considered separately and the more fundamental findings from research have often failed to reach those involved directly or indirectly in commercial crop production Similarly the research scientist is often unaware of the problems of commercial crop production and the possible relevance of his work to the crop This book is an attempt to rectify that situation By giving a thorough scientific review of all factors influencing tomato production systems it is hoped that this book will prove useful to students researchers and commercial producers alike It gives the basis for the development of improved cultivars the formulation of strategies for managing pest disease and disorder problems and the production of high yields of good quality fruit as well as suggesting important areas for scientific initiatives The extensive bibliographies provide a comprehensive database for tomato
