The Psychology of Learning Science Shawn M. Glynn, Russell H. Yeany, Bruce K. Britton, 1991 First Published in 1991 Routledge is an imprint of Taylor Francis an informa company Encyclopedia of the Sciences of Learning Norbert M. Seel, 2011-10-05 Over the past century educational psychologists and researchers have posited many theories to explain how individuals learn i e how they acquire organize and deploy knowledge and skills The 20th century can be considered the century of psychology on learning and related fields of interest such as motivation cognition metacognition etc and it is fascinating to see the various mainstreams of learning remembered and forgotten over the 20th century and note that basic assumptions of early theories survived several paradigm shifts of psychology and epistemology Beyond folk psychology and its naive theories of learning psychological learning theories can be grouped into some basic categories such as behaviorist learning theories connectionist learning theories cognitive learning theories constructivist learning theories and social learning theories Learning theories are not limited to psychology and related fields of interest but rather we can find the topic of learning in various disciplines such as philosophy and epistemology education information science biology and as a result of the emergence of computer technologies especially also in the field of computer sciences and artificial intelligence As a consequence machine learning struck a chord in the 1980s and became an important field of the learning sciences in general As the learning sciences became more specialized and complex the various fields of interest were widely spread and separated from each other as a consequence even presently there is no comprehensive overview of the sciences of learning or the central theoretical concepts and vocabulary on which researchers rely The Encyclopedia of the Sciences of Learning provides an up to date broad and authoritative coverage of the specific terms mostly used in the sciences of learning and its related fields including relevant areas of instruction pedagogy cognitive sciences and especially machine learning and knowledge engineering This modern compendium will be an indispensable source of information for scientists educators engineers and technical staff active in all fields of learning More specifically the Encyclopedia provides fast access to the most relevant theoretical terms provides up to date broad and authoritative coverage of the most important theories within the various fields of the learning sciences and adjacent sciences and communication technologies supplies clear and precise explanations of the theoretical terms cross references to related entries and up to date references to important research and publications The Encyclopedia also contains biographical entries of individuals who have substantially contributed to the sciences of learning the entries are written by a distinguished panel of researchers in the various fields of the learning sciences **Visible Learning and the Science of How We Learn** John Hattie, Gregory C. R. Yates, 2013-10-08 On publication in 2009 John Hattie's Visible Learning presented the biggest ever collection of research into what actually works in schools to improve children's learning Not what was fashionable not what political and educational vested interests wanted to champion but what actually produced the best results in terms of improving learning and educational outcomes It

became an instant bestseller and was described by the TES as revealing education's holy grail. Now in this latest book John Hattie has joined forces with cognitive psychologist Greg Yates to build on the original data and legacy of the Visible Learning project showing how its underlying ideas and the cutting edge of cognitive science can form a powerful and complimentary framework for shaping learning in the classroom and beyond. Visible Learning and the Science of How We Learn explains the major principles and strategies of learning outlining why it can be so hard sometimes and yet easy on other occasions. Aimed at teachers and students it is written in an accessible and engaging style and can be read cover to cover or used on a chapter by chapter basis for essay writing or staff development. The book is structured in three parts: learning within classrooms, learning foundations which explains the cognitive building blocks of knowledge acquisition and knowing thyself which explores confidence and self-knowledge. It also features extensive interactive appendices containing study guide questions to encourage critical thinking, annotated bibliographic entries with recommendations for further reading, links to relevant websites and YouTube clips. Throughout the authors draw upon the latest international research into how the learning process works and how to maximise impact on students covering such topics as teacher personality, expertise and teacher-student relationships, how knowledge is stored and the impact of cognitive load, thinking fast and thinking slow, the psychology of self-control, the role of conversation at school and at home, invisible gorillas and the IKEA effect, digital native theory, myths and fallacies about how people learn. This fascinating book is aimed at any student, teacher or parent requiring an up-to-date commentary on how research into human learning processes can inform our teaching and what goes on in our schools. It takes a broad sweep through findings stemming mainly from social and cognitive psychology and presents them in a useable format for students and teachers at all levels from preschool to tertiary training institutes.
