Index Medicus ,1978 *Clinical Psychometrics: Old Issues and New Perspectives* Michela Balsamo,Marco
 Innamorati,Dorian A. Lamis,2019-09-20 Clinical Psychometrics can be defined as a discipline that deals with the definition
 and measurement of clinical constructs Among its interests it includes dimensions such as skills behavior psychopathology
 quality of life and personality Indeed this discipline focuses on individual differences the theory of measurement the
 construction of measure instruments and their application in an international context Clinical Psychometrics can be
 considered as an essential tool in many fields of research related to psychological and psychiatric interventions for example it
 is useful for diagnostic assessment in various fields including clinical and forensic areas for the design and evaluation of
 specific psychological and pharmacological treatments Therefore Clinical Psychometrics is an applied discipline using
 psychometric tools to develop evidence based type procedures relating to the understanding and improvement of the
 psychological conditions of individuals This Research Topic on Clinical Psychometrics is interested in several aspects of
 measurement of psychological variables focusing on the two fundamental paradigmatic aspects of the discipline the Classical
 Test Theory and the Item Response Theory This Research Topic seeks to stimulate a scientific debate between
 psychotherapists and psychometricians in this area It could have applicative fallouts such as designing trans cultural studies
 in order to 1 investigate the invariance of new instruments for measuring clinical variables 2 test the invariance of existing
 instruments used in clinical research 3 develop more refined measure instruments for the evaluation of clinical dimensions
 similarly to work conducted by the Obsessive Compulsive Cognitions Working Group in identifying domains considered
 central to OCD and developing the 87 item Obsessive Beliefs Questionnaire 4 evaluate therapeutic outcomes and processes
 such as states stress psychological distress psychological adjustment to illness health related quality of life mood disorders
 sexual functioning etc The goal of this Research Topic is to disseminate a culture of integration between psychometric model
 and clinical model promoting the scientific debate about the deepening of the existing methods and or the proposal of new
 methods capable of combining clinical significance with quantitative rigor This Research Topic welcomed all types of articles
 with the exception of case reports We were particularly interested in 1 Systematic reviews shedding new lights on the
 psychometric properties of the most used psychological measures in clinical psychology neuroscience psychiatry
 psychosomatics etc 2 Guidelines and suggestions on the correct use and gold standards in psychological assessment in the
 form of research studies and brief reports on the development of new measures and adaptation of existing ones
