Abstract: In the article, dosimetry of ionizing radiation considers the properties of ionizing radiation, physical quantities describing the field of radiation or the interaction of radiation with substances, as well as the principles and methods of their determination.

Dosimetry deals with the physical quantities associated with expected radiation exposure. These quantities are usually called dosimetric. The established relationship between the measured physical quantity and the expected radiation effect is the most important feature of dosimetric quantities. Without this connection, dosimetric measurements lose their meaning.

Key words: Ionizing radiation, radiation effect, dosimetry, nuclide activity in a radioactive source, exposure dose rate.

Introduction

The main cause of radiation exposure is the absorption of ionizing radiation energy by the irradiated object, and the dose as a measure of absorbed energy is the main dosimetric quantity.

Quantification of the radiation dose affecting a living organism is necessary, first of all, for the identification, assessment and prevention of possible radiation hazards for humans. If hygienists and radiobiologists need to answer the question of what are the maximum permissible levels of radiation from the point of view of biological risk, dosimeters must ensure the correct measurement (determination) of these levels.

The development of dosimetry was initially fully determined by the need to protect people from the harmful effects of ionizing radiation. Soon after the discovery of X-rays (1895), its harmful effects

Stabin, 2007-09-12 This text is meant to serve as the basis for a two course series in the study of radiation protection and health physics. The first course would be an introduction to and a fast paced overview of the subject. For some this is the only course in radiation protection that they will take and thus all material must be covered in a fairly superficial and rapid fashion. The second course is a more in depth and applied study of radiation protection bringing in current materials from the literature, a detailed study of regulations, practice with real world dose and shielding calculations and perhaps application in a semester long student project assigned by the instructor. Several chapters include an additional section of suggested readings and other resources that can be used by the instructor to build such detailed investigations in a second course of this nature. In the first course the chapter may be basically studied with reference to the idea that a much richer literature base exists than can be covered in a broad overview of radiation protection. Through exploration of this literature base and other similar materials that the instructor may be aware of that are not specifically cited this second more in depth course may be developed. A routine part of any good health physics program is a complete course in radiation detection and measurement.

My brief overview chapter here cannot provide the depth needed for this subject. **Radiation Protection Dosimetry** Jack A. Simmons, David E. Watt, 2025-09-01 Background Physicist Jack Simmons research led him to develop a new paradigm to quantify radiation effects. He questioned both the International Commission on Radiation Units and Measurements (ICRU) and the International Commission on Radiological Protection (ICRP) which had established the definition and measurement of radiation dose on physical principles. Jack Simmons maintained that measurement of radiation dose should be based on the biological effects of radiation at the DNA level and his proposed model for radiation protection dosimetry was based primarily on radiation fluence rather than dose. The book *Radiation Protection Dosimetry: A Radical Reappraisal* was originally published in 1999. It was the first major effort to present an alternative approach to previous radiation protection dosimetry and the new bio-effectiveness model marked a new approach which challenged traditional thinking. The book analyses the defects and limitations of the traditional radiation protection paradigm, recording the history of its evolution, primarily the roles of the ICRP and the ICRU and documents scientific lapses. A detailed description of the various radiobiological models to describe the health effects of radiation is also presented. Lasting Impact: The book made waves in radiation protection circles as at that time all radiation protection standards were based on epidemiological studies mainly relying on data from the Nagasaki and Hiroshima bomb survivors. However in 2020 the ICRU and the ICRP published an alternative approach to their definition of operational radiation protection quantities that went some of the way towards concurring with Jack Simmons' views and proposals set out in the book. For this reason the decision was made to reissue this important work.

Radiation Protection J. W. Stather,2004 Human Exposure to Pollutants via Dermal Absorption and Inhalation Mihalís Lazaridis,Ian Colbeck,2010-03-22 Estimates of the air pollution health impact play a crucial role in environmental protection These estimates require accurate data on the pollutant exposure and dose to the population as well as the dose response relationships to calculate the health impact From an air quality manager s perspective there is concern about the validity and accuracy of these calculations There is a need for information and possible ways to adjust the assessment One important topic for air quality managers is to understand the relative contribution of sources to the total exposure These sources may be coming from both different outdoor sources from sectors such as transport industry and energy industries and from a number of indoor sources such as heating ventilation and indoor activities as well as outgassing from building material and furniture Indoor air quality is now drawing the attention of policy makers The basic right to and importance of healthy indoor air was emphasized by the World Health Organization as early as 2000 and several countries have described target concentrations for

various pollutants The WHO Air Quality Guidelines 2005 recommended the development of specific guidelines for indoor air quality and these are expected to be published soon Indoor air pollutants have not been as extensively monitored as outdoor air pollutants and the evidence base for contributions to health effects needs to be strengthened

Airborne Radioactive Contamination in Inhabited Areas, 2009-08-14 For many decades investigations of the behaviour and implications of radioactive contamination in the environment have focused on agricultural areas and food production This was due to the erroneous assumption that the consequences of credible contaminating incidents would be restricted to rural areas However due to the Chernobyl accident more than 250 000 persons were removed from their homes demonstrating a great need for knowledge and instruments that could be applied to minimise the manifold adverse consequences of contamination in inhabited areas Also today the world is facing a number of new threats including radiological terrorism which would be likely to take place in a city where most people would become directly affected A recent report from the US Commission on the Prevention of Weapons of Mass Destruction Proliferation and Terrorism concludes that it is most likely that a large radiological or even nuclear terror attack on a major city somewhere in the world will occur before 2013 For the first time ever the specific problems of airborne radioactive contamination in inhabited areas are treated in a holistically covering treatise pinpointing factorial interdependencies and describing instruments for mitigation The state of the art knowledge is here explained in Airborne Radioactive Contamination in Inhabited Areas by leading scientists in the various disciplines of relevance Unique holistic description of airborne radioactive contamination of inhabited areas and its consequences State of the art information on problems associated with both accidental and malicious contamination events in particularly dirty bombs Detailed description of processes and parameters governing the severity of contaminating incidents Written by key experts in the world **Cumulated Index Medicus**, 1970
