

Tectonic Plates

When geophysicist Alfred Wegener suggested in 1912 that the continents were moving, the idea seemed fantastic. There was no way to explain the idea. Only a half-century later, plate tectonic theory was able to offer an explanation of the phenomenon, volcanic activity on the ocean floor, convection currents, and the melting of rock in the mantle power the continental drift that is still making the planet's surface today.

Continental Drift

The first ideas on continental drift came from the continents themselves. The continents were moving. They were moving apart, and they were moving together. They were moving in a way that was not possible if the continents were fixed in place. The continents were moving, and they were moving in a way that was not possible if the continents were fixed in place.

The Hidden Motor

Convection currents of molten rock in the mantle are the hidden motor that drives the continents. The continents are moving, and they are moving in a way that is not possible if the continents were fixed in place.

250 MILLION YEARS AGO

The continents were once joined together in a single mass, and they were moving apart.

180 MILLION YEARS AGO

The North American Plate has separated from the Atlantic Plate. The supercontinent Pangea is breaking apart, and the continents are moving apart.

100 MILLION YEARS AGO

The Atlantic Ocean has formed. The continents are moving apart, and the Atlantic Ocean is expanding.

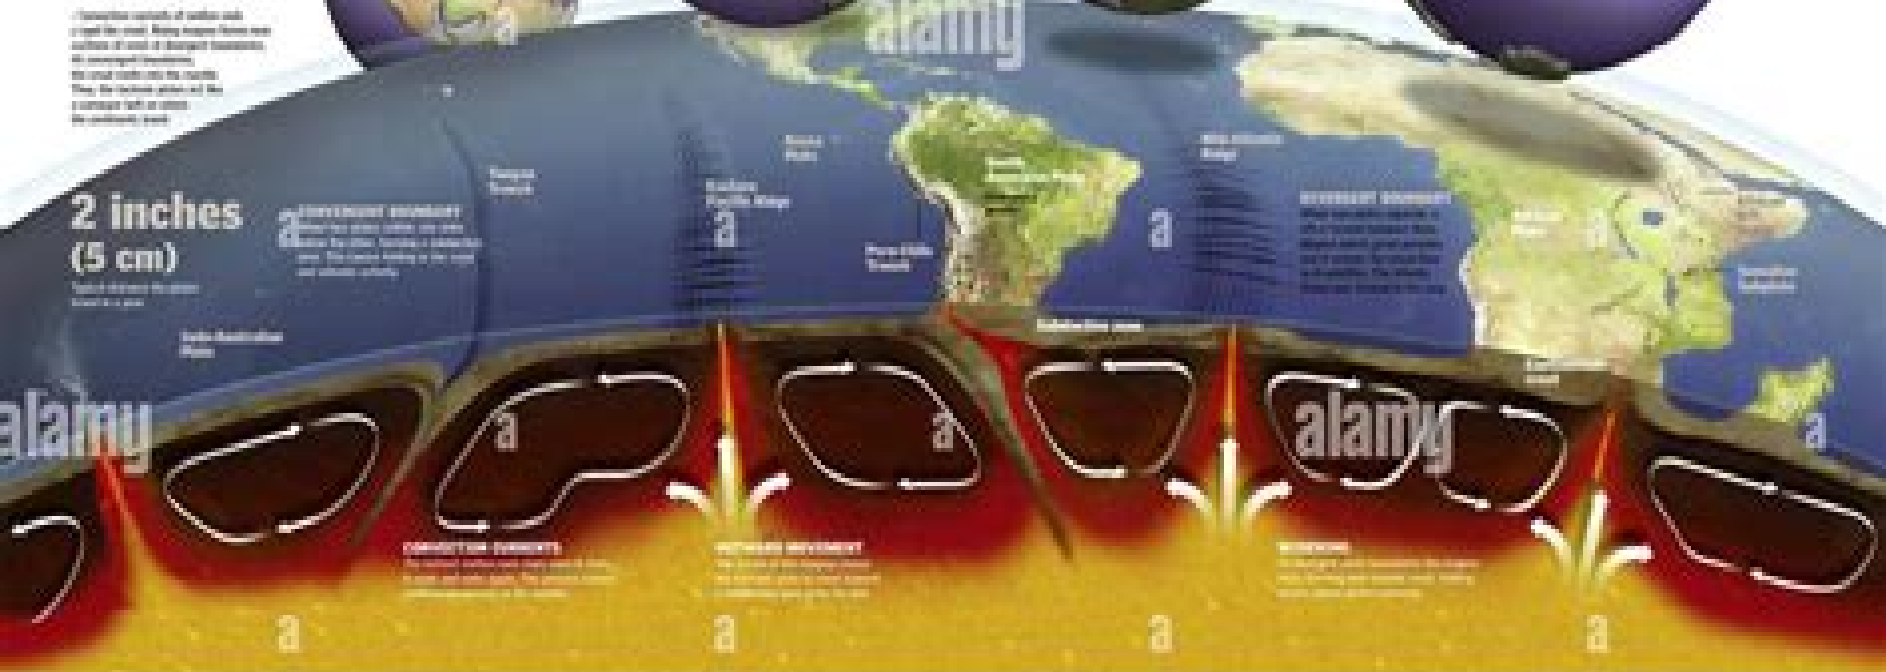

60 MILLION YEARS AGO

The continents are now their present location. The Atlantic Ocean is expanding, and the Pacific Ocean is contracting.
