Information System Gilad J. Kuperman, Reed M. Gardner, T. Allan Pryor, 2013-03-12 This monograph series is intended to provide medical information scientists health care administrators health care providers and computer science professionals with successful examples and experiences of computer applications in health care settings Through the exposition of these computer applications we attempt to show what is effective and efficient and hopefully provide some guidance on the acquisition or design of information systems so that costly mistakes can be avoided The health care industry is currently being pushed and pulled from all directions from the clinical side to increase quality of care from the business side to improve financial stability from the legal and regulatory sides to provide more detailed documentation and in a university environment to provide more data for research and improved opportunities for education Medical information systems sit in the middle of all these demands They are not only asked to provide more better and more timely information but also to interact with and monitor the process of health care itself by providing clinical reminders warnings about adverse drug interactions alerts to questionable treatment alarms for security breaches mail messages workload schedules etc Clearly medical information systems are functionally very rich and demand quick response time and a high level of security They can be classified as very complex systems and from a developer's perspective as risky systems **Medical Informatics**

Warner, Dean K. Sorenson, Omar Bouhaddou, 2012-12-06 This monograph series is intended to provide medical information scientists health care administrators physicians nurses other health care providers and computer science professionals with successful examples and experiences of computer applications in health care settings Through these computer applications we attempt to show what is effective and efficient and hope to provide guidance on the acquisition or design of medical information systems so that costly mistakes can be avoided Health care provider organizations such as hospitals and clinics are experiencing large demands for clinical information because of a transition from a fee for service to a capitation based health care economy This transition changes the way health care services are being paid for Previously nearly all health care services were paid for by insurance companies after the services

were performed Today many procedures need to be pre approved and many charges for clinical services must be justified to the insurance plans Ultimately in a totally capitated system the more patient care services are provided per patient the less profitable the health care provider organization will be Clearly the financial risks have shifted from the insurance carriers to the health care provider organizations For hospitals and clinics to assess these financial risks management needs to know what services are to be provided and how to reduce them without impacting the quality of care The balancing act of reducing costs but maintaining health care quality and patient satisfaction requires accurate information about the clinical services
