Evolutionary Aspects of Nutrition and Health Artemis P. Simopoulos, 1999-01-01 The issues treated in this publication are brought together in this way for the first time For many of the chronic diseases familial predispositions are well established and there is good evidence for true genetic predisposition When *Homo erectus* emerged 1.7 million years ago humans existed as non cereal eating hunter gatherers It is on this basis that according to the hypothesis of the carnivore connection an insulin resistant genotype evolved to provide survival and reproductive advantages to populations adapted to a high meat low plant food low carbohydrate nutritional environment Cereal became the major source of calories and protein in the human diet only about 10 000 years ago Humankind has thus had little evolutionary experience to adapt to this new food type maladaptation being the consequence Moreover studies comparing energy expenditure in Western societies and during the

Paleolithic period indicate a low level of physical activity not previously encountered in human history a state to which humans are not genetically adapted Together with the dietary changes this has led to a modern environment in which a number of individuals are prone to chronic diseases causing increases in non insulin dependent diabetes mellitus hypertension coronary artery disease cancer and obesity As a consequence the lifestyle approach for the prevention and management of these diseases is essential varying with national dietary patterns and national economy This publication will be of special interest to physicians geneticists nutritionists dieticians anthropologists food technologists food policy makers and individuals interested in personal and family health

**Understanding Insulin-dependent Diabetes** H. Peter Chase,2000 Describes in detail the topics covered in the three day diabetes treatment plan conducted at the University of Colorado Health Sciences Center **Agrindex** ,1995 Nutrition and Fitness Artemis P. Simopoulos,2005-01-01 Despite the enormous interest in discovering longevity genes in humans the results have been elusive while the effects of physical activity in delaying aging are promising and the importance of caloric restriction is now being systematically investigated At present there is enough evidence to define the components of a healthy diet and physical activity lifestyle at the population level and it is clear that lack of exercise is associated with increased risk of premature chronic disease and death Currently research aims at defining the type and frequency of genetic variation and its influ Nutrition and Fitness: Mental Health, Aging, and the Implementation of a Healthy Diet and Physical Activity Lifestyle A. **Resources in Education** ,1998 *Human Body Size and the Laws of Scaling* Thomas T. Samaras,2007 Several books have been published on scaling in biology and its ramifications in the animal kingdom However none has specifically examined the multifaceted effects of how changes in human height create disproportionately larger changes in weight surface area strength and other physiological parameters Yet the impact of these non linear effects on individual humans as well as our world s environment is enormous Since increasing human body size has widespread ramifications this book

presents findings on the human species and its ecological niche its community and how the species interacts with its environment Thus a few chapters provide an ecological overview of how increasing human body size relates to human evolution fitness health survival and the environment This book provides a unique purview of the laws of scaling on human performance health longevity and the environment Numerous examples from various research disciplines are used to illustrate the impact of increasing body size on many aspects of human enterprises including work output athletics and intellectual performance

**The Oxford Handbook of Evolutionary Medicine** Martin Brüne, Wulf Schiefenhövel, 2019-01-31 Medicine is grounded in the natural sciences where biology stands out with regard to our understanding of human physiology and the conditions that cause dysfunction Ironically though evolutionary biology is a relatively disregarded field One reason for this omission is that evolution is deemed a slow process Indeed the macroanatomical features of our species have changed very little in the last 300 000 years A more detailed look however reveals that novel ecological contingencies partly in relation to cultural evolution have brought about subtle changes pertaining to metabolism and immunology including adaptations to dietary innovations as well as adaptations to the exposure to novel pathogens Rapid pathogen evolution and evolution of cancer cells cause major problems for the immune system Moreover many adaptations to past ecologies have actually turned into risk factors for somatic disease and psychological disorder in our modern worlds i e mismatch among which epidemics of autoimmune diseases cardiovascular diseases diabetes and obesity as well as several forms of cancer stand out One could add depression anxiety and other psychiatric conditions to the list The Oxford Handbook of Evolutionary Medicine is a compilation of up to date insights into the evolutionary history of ourselves as a species exploring how and why our evolved design may convey vulnerability to disease Written in a classic textbook style emphasising physiology and pathophysiology of all major organ systems the Oxford Handbook of Evolutionary Medicine is valuable reading for students as well as scholars in the fields of medicine biology

anthropology and psychology      **New Developments in Obesity Research** Lawrence F. Ditmier, 2006 Far from a sign of healthy prosperity and contentment overweight and obesity are now considered high risk factors for a wide range of diseases including early death and disability heart disease diabetes reproductive problems cancer breathing problems and arthritis Obesity now at epidemic levels in many countries is defined as an excessively high amount of body fat or adipose tissue in relation to lean body mass The amount of body fat or adiposity includes concern for both the distribution of fat throughout the body and the size of the adipose tissue deposits This book includes within its scope the causal connection of obesity to diseases as well as the prevention and treatment of obesity Leading edge scientific research from throughout the world is presented      Official Gazette of the United States Patent and Trademark Office ,2002      **Omega-6/omega-3 Essential Fatty Acid Ratio** Artemis P. Simopoulos, Leslie G. Cleland, 2003-01-01 Studies on the evolutionary aspects of diet and molecular studies included in this volume indicate that human beings evolved on a diet that was balanced in the essential fatty acids EFA In fact the ratio of omega 6 omega 3 EFA was 1 : 1 whereas present day diets in both developed and developing countries have a much higher ratio between 5 : 1 and 50 : 1 Additional studies show that a high ratio of omega 6 omega 3 EFA is detrimental to health and may lead to the development of chronic diseases Improving the dietary ratio by decreasing the omega 6 fatty acids and increasing the omega 3 fatty acids is essential for brain function and for the management of cardiovascular disease arthritis and cancer A ratio of 4 : 1 or less leads to lower dosage and to the reduction of adverse effects of drugs This volume should be of interest to a large and varied audience of researchers in academia industry and government cardiologists geneticists immunologists neuroscientists and cancer specialists as well as nutritionists dietitians food scientists agriculturists economists and regulators      Evolution of the Human Diet Peter S. Ungar, 2007 We are interested in the evolution of hominin diets for several reasons One is the fundamental concern over our present day eating habits and the consequences of our societal choices such as obesity prevalent in some cultures and starvation in others Another is that humans have learned to feed themselves in extremely varied environments and these adaptations which are fundamentally different from those of our closest biological relatives have to have had historical roots of varying depth The third and the reason why most paleoanthropologists are interested in this question is that a species trophic level and feeding adaptations can have a strong effect on body size locomotion life history strategies geographic range habitat choice and social behavior Diet is key to understanding the ecology and evolution of our distant ancestors and their kin the early hominins A study of the range of foods eaten by our progenitors underscores just how unhealthy many of our diets are today This volume brings together authorities from disparate fields to offer new insights into the diets of our ancestors Paleontologists archaeologists primatologists nutritionists and other researchers all contribute pieces to the puzzle This volume has at its core four main sections Reconstructed diets based on hominin fossils tooth size shape structure wear and chemistry mandibular biomechanics Archaeological evidence of subsistence stone tools and modified bones Models of early

hominin diets based on the diets of living primates both human and non human paleoecology and energetics Nutritional analyses and their implications for evolutionary medicine New techniques for gleaning information from fossil teeth bones and stone tools new theories stemming from studies of paleoecology and new models coming from analogy with modern humans and other primates all contribute to our understanding When these approaches are brought together they offer an impressive glimpse into the lives of our distant ancestors The contributions in this volume explore the frontiers of our knowledge in each of these disciplines as they address the knowns the unknowns and the unknowables of the evolution of hominin diets
