population studies from the cell to whole organs and the genome to whole body *Behavioral Neuroscience of Drug Addiction* David W. Self, Julie K. Staley, Gottschalk, 2009-12-18 Drug addiction is a chronically relapsing mental illness involving severe motivational disturbances and loss of behavioral control leading to personal deviation. The disorder affects millions of people, often co-occurring with other mental illnesses, with enormous social and economic costs to society. Several decades of research have established that drugs of abuse hijack the brain's natural reward substrates and that chronic drug use causes aberrant alterations in these reward processing systems. Such aberrations may be demonstrated at the cellular, neurotransmitter, and regional levels of information processing using either animal models or neuroimaging in humans following chronic drug exposure. Behaviorally, these neural aberrations manifest as exaggerated, altered, or dysfunctional expression of learned behavioral responses related to the pursuit of drug rewards or to environmental factors that precipitate craving and relapse during periods of drug withdrawal. Current research efforts are aimed at understanding the associative and causal relationships between these neurobiological and behavioral events such that treatment options will ultimately employ therapeutic amelioration of neural deficits and restoration of normal brain processing to promote efforts to abstain from further drug use. The *Behavioral Neuroscience of Drug Addiction*, part of the Springer series on Current Topics in Behavioral Neurosciences, contains scholarly reviews by noted experts on multiple topics from both basic and clinical neuroscience fields.

Aspects of Psychopharmacology David J. Sanger, Derek E. Blackman, 2016-10-14 The study of drug effects on behaviour and psychological processes has a long history. Developments in the decade prior to first publication had been based on a more adequate synthesis than hitherto of psychology and pharmacology and as a result great progress was made in establishing psychopharmacology as an interdisciplinary subject in its own right. Undergraduate courses in departments of psychology and pharmacology were increasingly including some coverage of this material but there was a paucity of texts suitable at this level at the time. Originally published in 1984, this book was designed to provide broad coverage of psychopharmacology with the minimum necessary focus on basic pharmacology and with carefully chosen subjects which are still likely to be of interest to psychology undergraduates and in which good empirical work is available for discussion at that level. The emphasis throughout the book is on the needs of psychology students but the contents will also interest pharmacology students.
