The Radiation Chemistry of Macromolecules Malcolm Dole, 2013-10-22 The Radiation Chemistry of Macromolecules Volume II is a collection of papers that discusses radiation chemistry of specific systems Part 1 deals with radiation chemistry of substituted vinyl polymers particularly polypropylene PP as its structure is intermediate between polyethylene and polyisobutylene This part also discusses polypropylene oxide PPOx for it can be prepared in the atactic isotactic and optically active forms One paper focuses on the fundamental chemical processes and the changes in physical properties that give rise to many different applications of polystyrene Another paper analyzes poly methyl methacrylate and poly isobutylene two important polymers of nongelling substances subject to radiation Part 2 describes the radiation chemistry of some miscellaneous polymers including the formation of free radicals and their termination One paper also considers the radiation chemistry of polytetrafluoroethylene PTFE which is widely used in industry Part 3 discusses the effect of radiation on oxidation mechanical properties and physical state of polymers Part 4 addresses macromolecules particularly the radiation chemistry of biopolymers because of their role in radiation chemistry The damage done to biopolymers through radiation can affect the responses of living organisms to ionizing radiation This book can prove valuable to scientists and researchers in the fields of nuclear biology nuclear science microchemistry and cellular biology

The Radiation Chemistry of Macromolecules Malcolm Dole, 2012-12-02 The Radiation Chemistry of Macromolecules is the first from a two volume series aiming to contribute to the radiation chemistry in general The chapters in this volume are divided into two major parts where the first part deals with the basic processes and theory while the second part tackles experimental techniques and applications to polyethylene Part I focuses on the discussion on general principles of radiation effects fundamental concepts on energy transfer and the theory of free radicals The subject of polymers is discussed thoroughly in several chapters including its molecular mobilities and electrical conductivity Part II presents experimental techniques and a description of the radiation chemistry of a single polymer This part also includes a discussion on the morphology of polyethylene and free radicals in irradiated polyethylene This book is an important reference to students and scientists in the field of radiation chemistry of macromolecules

Comprehensive Nuclear Materials ,2020-07-22 Materials in a nuclear environment are exposed to extreme conditions of radiation temperature and or corrosion and in many cases the combination of these makes the material behavior very different from conventional materials This is evident for the four major technological challenges the nuclear technology domain is facing currently i long term operation of existing Generation II nuclear power plants ii the design of the next generation reactors Generation IV iii the construction of the ITER fusion reactor in Cadarache France iv and the intermediate and final disposal of nuclear waste In order to address these challenges engineers and designers need to know the properties of a wide variety of materials under these conditions and to understand the underlying processes affecting changes in their behavior in order to assess their performance and to determine the limits of operation Comprehensive Nuclear Materials Second Edition Seven Volume Set provides broad ranging validated summaries of all the major topics in the field of nuclear material research for fission as well as fusion reactor systems Attention is given to the fundamental scientific aspects of nuclear materials fuel and structural materials for fission reactors waste materials and materials for fusion reactors The articles are written at a level that allows undergraduate students to understand the material while providing active researchers with a ready reference resource of information Most of the chapters from the first Edition have been revised and updated and a significant number of new topics are covered in completely new material During the ten years between the two editions the challenge for applications of nuclear materials has been significantly impacted by world events public awareness and technological innovation Materials play a key role as enablers of new technologies and we trust that this new edition of Comprehensive Nuclear Materials has captured the key recent developments Critically reviews the major classes and functions of materials supporting the selection assessment validation and engineering of materials in extreme nuclear environments Comprehensive resource for up to date and authoritative information which is not always available elsewhere even in journals Provides an in depth treatment of materials modeling and simulation with a specific focus on nuclear issues Serves as an excellent entry point for students and researchers new to the field

Materials and Processes for Next Generation Lithography ,2016-11-08 As the requirements of the semiconductor industry have become more demanding in terms of resolution and speed it has been necessary to push photoresist materials far beyond the capabilities previously envisioned Currently there is significant worldwide research effort in to so called Next Generation Lithography techniques such as EUV lithography and multibeam

electron beam lithography These developments in both the industrial and the academic lithography arenas have led to the proliferation of numerous novel approaches to resist chemistry and ingenious extensions of traditional photopolymers Currently most texts in this area focus on either lithography with perhaps one or two chapters on resists or on traditional resist materials with relatively little consideration of new approaches This book therefore aims to bring together the worlds foremost resist development scientists from the various community to produce in one place a definitive description of the many approaches to lithography fabrication Assembles up to date information from the world s premier resist chemists and technique development lithographers on the properties and capabilities of the wide range of resist materials currently under investigation Includes information on processing and metrology techniques Brings together multiple approaches to litho pattern recording from academia and industry in one place

A Science Career Against all Odds Bernhard Wunderlich, 2010-03-01

Today is Sunday June 17, 2007. Father's Day. Naturally, the obligatory carefully selected cards, phone calls and small gifts arrived from the children and grandchildren. Best wishes for Father's Day were also the first words in the morning from Heidi, my wife of 54 years. Although for many years I had made the comment "I am not your father," but in the frame of my life's experiences throughout the 20th century as I intend to summarize them over the next few years, the 17th of June has much deeper significance. This was the day in 1953 when we finally fled from our life of oppression which had lasted 20 years. Two successive dictatorships, one of Hitler and the other of Stalin, caused the most horrific slaughter of civilians and soldiers eclipsing all prior history. During these first years of my life, I was plainly lucky to survive. After this day, I had a much better chance to experience the freedom needed to lead a life of creativity, satisfaction and ultimately prosperity, all directed largely by our own decisions. The 17th of June, 1953, was a Wednesday. I stayed in the apartment of my parents in my hometown of Brandenburg in the German Democratic Republic (GDR), the former Russian-occupied zone of Germany. The summer vacation of the Humboldt University in East Berlin, some 40 miles further east, had just started. But I was alone with my father, Vati.
