Radiation Therapy Of Benign Diseases:

Radiation Therapy of Benign Diseases Stanley E. Order, Sarah S. Donaldson, 1990 This volume is designed as a practical text to aid the radiation oncologist in both the evaluation and treatment of benign disease The text begins with a chapter concerning standards of practice by an eminent malpractice lawyer thereby clarifying the medical legal implications of the radiation treatment of benign disease The text then lists in alphabetic order those benign diseases which have been or are currently treated with radiation therapy A risk benefit analysis for each disease is given in addition the editors provide summary statements on the use of radiotherapy for each disease entity A special feature is the survey of current radiation practice in the United States The authors also give a comprehensive reference list and abstracts in tabular form of the articles written on the subject in the past decade This complete update will become the standard text on the evaluation of radiotherapy for the treatment of benign disease

The Radiation Therapy of Benign Diseases J. L. Meyer, W. Hinkelbein, 2001-07 This volume discusses radiotherapy and its role in the treatment of benign diseases Its intent is to broaden the application of radiotherapy beyond malignancy to treat a range of clinical concerns from minor skin problems to life threatening arterial disease In addition it aims to encourage medical practitioners to consider the benefits versus the risks of radiotherapy and assess the most modern technology for uses that may benefit the greatest number of patients The major challenge in this field is to develop new strategies for the controlled use of radiotherapy This includes the ability to focus and control applications with equipment that can target tissues with high accuracy using new methods of isotopic and external beam introduction It also means minimizing the risk of uncontrolled radiation exposure by employing minimal doses and the smallest tissue volume required to achieve the desired effect The Radiation Therapy of Benign Diseases features articles written by internationally recognized experts who confront and critically discuss these major issues It will prove to be an essential and informative read not only for radiation therapists but also for internists surgeons ophthalmologists and biologists interested in this endeavor

Radiation Therapy of Benign Diseases David Roberge, Sarah S. Donaldson, 2023-08-02 This expanded and updated second edition is a practical text to aid radiation oncologists in evaluating and treating benign diseases An introductory chapter by an eminent malpractice lawyer clarifies the medical legal implications of the radiation treatment of such diseases and this is followed by the various benign conditions in alphabetical order In each case a brief summary is followed by citations of pertinent literature in both explanatory tables and reference lists Although a comprehensive review it remains readily comprehensible and will be recognised as the standard text on the subject

Radiotherapy of Benign Disease Stephen B. Dewing, 1965 *Radiotherapy for Non-Malignant Disorders* Michael Heinrich Seegenschmiedt, Hans-Bruno Makoski, Klaus-Rüdiger Trott, Luther W. Brady, 2009-04-15 Non malignant or benign diseases can be successfully treated using ionizing radiation technologies It was first proposed in 1898 by Sokoloff who reported the analgesic effects of radiotherapy for painful rheumatoid arthritis Since then the use of these techniques for

painful muscle skeletal diseases has gained acceptance particularly in Europe but is still carried out actively in the United States Non malignant diseases that are amenable to radiotherapy can be classified as inflammatory degenerative hyperproliferative functional or other disorders However the topographic and morphologic considerations are more relevant Even though radiation therapy for benign diseases has not been pursued actively since the 1950s more recent interest has dictated that it can be a very effective treatment modality The use of radiotherapy can be justified for invasive and aggressive growth such as that seen with desmoids for cosmetic deformations and functional loss as seen with keloids or endocrine orbitopathy or for life threatening complications such as hepatic hemangiomas or juvenile angiofibromas that occur in children or adolescents Many of the non malignant diseases can have a major and lasting effect on quality of life by causing pain or other serious symptoms particularly when other methods of treatment are unavailable have failed or may induce more side effects It is not generally the first choice of therapy in these non malignant diseases but it is acceptable as defined The book edited by Seegenschmiedt et al A Review of the Use of Ionizing Radiation for the Treatment of Benign Diseases: A report of the Committee to Review the Use of Ionizing Radiation for the Treatment of Benign Diseases Assembly of Life Sciences (U.S.). Committee to Review the Use of Ionizing Radiation for the Treatment of Benign Diseases, 1977 **Dupuytren's Disease** Michael B. Gottschalk, Nina Suh, Eric R. Wagner, 2025-04-26 Dupuytren's contractures are a very common pathology with a complex underlying pathophysiology that is associated with controversy regarding the proper treatment algorithm Although many patients do not develop contractures when the contractures do develop and hand function is compromised there remain multiple important considerations when deciding on the initial or ultimate treatment for these patients Although dermatofasciectomy with skin grafting and open fasciectomy have historically been the gold standard less invasive procedures including percutaneous needle aponeurotomy NA and clostridial collagenase injections have been gaining popularity in recent years This book provides a comprehensive yet concise discussion of Dupuytren's disease ranging from historical perspectives and background to current evidence based medicine outcomes for treatment It reviews the considerations for each of these treatments as well as other innovative strategies such as the digit widget The goal is to focus on surgical procedural techniques and tips to optimize outcomes while educating readers on how to make an evidence based decision taking into account patient outcomes and cost considerations With a world renowned panel of authors on this disease process the focus is on optimizing the reader's skillset for each treatment strategy In addition it is also important to understand some of the granularity as it relates to historical perspectives and what previous treatments may or may not have worked e.g. McCash technique This book also provides perspectives of the historical background up until today as well as groundbreaking work in regard to the genetic implications it may or may not have

Contemporary Topics in Radiation Medicine, Pt II: Disease Sites , An Issue of Hematology/Oncology Clinics of North America E-Book Ravi A. Chandra, Lisa A. Kachnic, Charles R. Thomas JR, 2019-11-28 This issue of Hematology Oncology Clinics guest edited by Ravi A Chandra Lisa A Kachnic and Charles R Thomas Jr is the second volume of Contemporary Topics in Radiation Medicine with focus on Disease Sites This issue is one of six selected each year by our series consulting editors Dr George P Canellos and Dr Edward J Benz Topics discussed in this issue will include Breast Central Nervous System GI Genitourinary Prostate Gynecologic Head Neck Thoracic Hematologic cancers including Leukemias Lymphomas Pediatric Cancer Sarcoma STS Skin Oligometastatic Disease Palliation Supportive Care Inpatient Medicine Radiation Emergencies among others **Clinical Target Volumes in Conformal and Intensity Modulated Radiation Therapy** Vincent Gregoire, Pierre Scalliet, Kie-Kian Ang, 2013-06-29 Conformal radiation therapy represents a new challenge for radiation oncologists It offers the prospect of either increasing the radiation dose to target tissues while

delivering a similar dose to organs at risk or reducing the dose to organs at risk while maintaining the dose to target tissues. First lymph node areas at risk are established using the available data from pathological examination of surgical specimens and or pattern of locoregional relapse. Then based on a three dimensional description of the anatomical regions where the areas at risk are located guidelines for the delineation of the clinical target volumes are proposed. The data presented should enable the reader to make appropriate decisions regarding the selection and delineation of the target volumes when confronted with the most frequent tumor types and sites. The book will contribute to paving the way for more effective radiation oncology in the twenty first century.

Radiation and the Immune System: Current Knowledge and Future Perspectives Katalin Lumnitzky, Serge M. Candéias, Udo S. Gaipl, Benjamin Frey, 2018-05-03

For long high dose ionizing radiation was considered as a net immune suppressing agent as shown among others by the exquisite radiosensitivity of the lymphoid system to radiation induced cell killing. However recent advances in radiobiology and immunology have made this picture more complex. For example the recognition that radiation induced bystander effects share common mediators with various immunological signalling processes suggests that they are at least partly immune mediated. Another milestone was the finding in the field of onco immunology that local tumor irradiation can modulate the immunogenicity of tumor cells and the anti tumor immune responsiveness both locally in the tumor microenvironment and at systemic level. These observations paved the way for studies exploring optimal combinations of radiotherapy and immunotherapy in order to achieve a synergistic effect to eradicate tumors. However not all interactions between radiation and the immune system are beneficial as it was recognized that many of radiation induced late side effects are also of immune and inflammatory nature. Currently perhaps the most studied field of research in radiation biology is focused around the biological effects of low doses where many of the observed pathophysiological endpoints are due to mechanisms other than direct radiation induced cell killing and are immune related. Finally it must not be forgotten that the interactions between the ionizing radiations and the immune system are bi directional and activation of the immune system also influences the outcome of radiation exposure. This Research Topic brings together 23 articles and aims to give an overview of the complex and very often contradictory nature of the interactions between ionizing radiation and the immune system. Due to its increasing penetrance in the population both through medical diagnostic or environmental sources or during cosmic travel low dose ionizing radiation exposure is becoming a major epidemiological concern world wide. Several of the articles within the Research Topic specifically address potential long term health consequences and the underlying mechanisms of low dose radiation exposure. A major intention of the Editors was also to draw the attention of the non radiobiological scientific community on the fact that ionizing radiation is by far more than purely an immune suppressing agent.

CURED I - LENT Late Effects of Cancer Treatment on Normal Tissues Philip Rubin, L.S. Constine, Lawrence B. Marks, Paul Okunieff, 2007-12-27 The rapid advances in radiation oncology radiation biology and radiation therapy physics have led to an accumulation of information on the interactions of radiation with other therapeutic modalities such as the wide array of chemotherapeutic agents being employed in combination with radiation therapy as well as the multiple biologic response modifiers that are being used in combination with radiation therapy It is now recognized that they have a significant impact on normal tissue toxicities The radiation doses customarily deemed safe on the basis of past experience have now when combined with other modalities led to severe late effects in different vital organs The previously defined radiation tolerance dosages remain as valuable guides but their applicability has changed significantly The emphasis is now placed on the volume of the organ irradiated as well as the dose being used New constructs relating global whole organ and focal partial volume injury as a function of the dose volume histogram emerge as a significant predictor of late effects on normal tissues There are now mathematical models such as the model on standard dose time dose factors and accumulated radiation effects that have been supplanted by linear quadratic equations using the alpha beta ratio and its clinical applicability to normal tissue complications This volume presents contemporary data relating to late effects on normal tissues
