- Compilers, assemblers, and loaders are traditional tools for developing programs in high-level languages. With the operating systems, these tools determine the kind of resources to applications, and the effectiveness of this determines the efficiency of hardware utilization and the system's programmability.
- Most programmers still employ a sequential mind set, abetted by a lack of popular parallel software support.

- Parallel software can be developed using entirely new languages designed specifically with parallel support as its goal, or by using extensions to existing sequential languages.
- New languages have obvious advantages, but require additional programmer education and systems software.
- The most common approach is to extend an existing language.

- Preprocessors use existing sequential compilers and specialized libraries to implement parallel constructs
- Precompilers perform some program flow analysis, dependence checking, and limited parallel optimizations
- Parallelizing Compilers requires full detection of parallelism in source code, and transformation of sequential code into parallel constructs
- Compiler directives are often inserted into source code to aid compiler parallelizing efforts
