presents a case study format on the planning and implementation of alternative cropping systems designed to maximize
incident sunlight and bio support of all crops in a rotation system The book describes the basic component of the system an
increased access point of incident sunlight between each row or pairs of rows that enables a more uniform vertical
distribution of incident sunlight to chloroplasts within the entire corn leaf canopy While the production environment and
environment specific genetics determine the performance potential of this principle by maximizing the principles that light is
basic to crop yield a solar corridor ultimately contributes to increased grain yield Written by experts who were integral in the
development of solar corridor systems and providing real world examples of the methods challenges and future prospects
this book will be valuable for those seeking to increase yield per acre through both primary and cover crops Introduces
readers to the concept of alternative row cropping and its implementation Presents real world experience including
