Radicals On Surfaces:

Radicals on Surfaces A. Lund, C.J. Rhodes, 2012-12-06 Studies of free radicals on surfaces are of interest for several reasons the spontaneous or stimulated formation of radicals from adsorbed molecules may represent one possible mechanism for heterogeneous catalysis In some cases the radicals are ionic indicating that primary oxidation and reduction reactions occur Radicals can also be used as probes to investigate diffusion processes on catalytic surfaces The first direct observations were made more than 30 years ago but detailed studies of structure reactions and mobility have only recently become feasible with the advent of powerful spectroscopic techniques to a great extent developed and used by the contributors to this volume This comprehensive review describes new trends in the field Leading experts write about the nature of surface active sites methods to identify them and the radicals formed from adsorbed molecules interacting with the surface The emphasis is on the fundamentals covering thermal photostimulated and radiation induced reactions as well as diffusion processes This provides the necessary background for technological applications This book will be useful to those who are interested in surface chemistry heterogeneous catalysis as well as those who want to study reactive intermediates in chemical reactions It is also of interest to scientists in photo and radiation physics and chemistry *Controlled Radical Polymerization at and from Solid Surfaces* Philipp Vana, 2015-08-11 The series Advances in Polymer Science presents critical reviews of the present and future trends in polymer and biopolymer science It covers all areas of research in polymer and biopolymer science including chemistry physical chemistry physics material science The thematic volumes are addressed to scientists whether at universities or in industry who wish to keep abreast of the important advances in the covered topics Advances in Polymer Science enjoys a longstanding tradition and good reputation in its community Each volume is dedicated to a current topic and each review critically surveys one aspect of that topic to place it within the context of the volume The volumes typically summarize the significant developments of the last 5 to 10 years and discuss them critically presenting selected examples explaining and illustrating the important principles and bringing together many important references of primary literature On that basis future research directions in the area can be discussed Advances in Polymer Science volumes thus are important references for every polymer scientist as well as for other scientists interested in polymer science as an introduction to a neighboring field or as a compilation of detailed information for the specialist Review articles for the individual volumes are invited by the volume editors Single contributions can be specially commissioned Readership Polymer scientists or scientists in related fields interested in polymer and biopolymer science at universities or in industry graduate students **The Plasma Chemistry of Polymer Surfaces** Jörg Florian Friedrich, 2012-02-13 More than 99% of all visible matter in the universe occurs as highly ionized gas plasma with high energy content Electrical low and atmospheric pressure plasmas are characterized by continuous source of moderate quantities of energy or enthalpy transferred predominantly as kinetic energy of electrons Therefore such energetically unbalanced plasmas have low gas

temperature but produce sufficient energy for inelastic collisions with atoms and molecules in the gas phase thus producing reactive species and photons which are able to initiate all types of polymerizations or activate any surface of low reactive polymers. However the broadly distributed energies in the plasma exceed partially the binding energies in polymers thus initiating very often unselective reactions and polymer degradation. The intention of this book is to present new plasma processes and new plasma reactions of high selectivity and high yield. This book aims to bridge classical and plasma chemistry particularly focusing on polymer chemistry in the bulk and on the surface under plasma exposure. The stability of surface functionalization and the qualitative and quantitative measurement of functional groups at polymer surface are featured prominently and chemical pathways for suppressing the undesirable side effects of plasma exposure are proposed and illustrated with numerous examples. Special attention is paid to the smooth transition from inanimate polymer surfaces to modified bioactive polymer surfaces. A wide range of techniques, plasma types and applications are demonstrated.

Photochemistry on Solid Surfaces Takeshi Matsuura, M. Anpo, 1989-06-01. The latest developments in photochemistry on solid surfaces i.e. photochemistry in heterogeneous systems including liquid crystallines are brought together for the first time in a single volume. Distinguished photochemists from various fields have contributed to the book which covers a number of important applications: molecular photo devices for super memory, photochemical vapor deposition to produce thin layered electronic semiconducting materials, sensitive optical media, the control of photochemical reactions, pathways etc. Photochemistry on solid surfaces is now a major field and this book which provides an up to date and comprehensive overview of the subject will be of interest to a wide range of readers.

EPR of Free Radicals in Solids II Anders Lund, Masaru Shiotani, 2012-12-09. EPR of Free Radicals in Solids: Trends in Methods and Applications 2nd ed. presents a critical two volume review of the methods and applications of EPR/ESR for the study of free radical processes in solids. Emphasis is on the progress made in the developments in EPR technology in the application of sophisticated matrix isolation techniques and in the advancement in quantitative EPR that have occurred since the 1st edition was published. Improvements have been made also at theoretical level with the development of methods based on first principles and their application to the calculation of magnetic properties as well as in spectral simulations. EPR of Free Radicals in Solids II focuses on the trends in applications of experimental and theoretical methods to extract structural and dynamical properties of radicals and spin probes in solid matrices by continuous wave (CW) and pulsed techniques in nine chapters written by experts in the field. It examines the studies involving radiation and photo induced inorganic and organic radicals in inert matrices, the high spin molecules and metal based molecular clusters as well as the radical processes in photosynthesis. Recent advancements in environmental applications including measurements by muon resonance of radicals on surfaces and by quantitative EPR in dosimetry are outlined and the applications of optical detection in material research with much increased sensitivity reviewed. The potential use of EPR in quantum computing is considered in a newly written chapter. This new edition is aimed

to experimentalists and theoreticians in research involving free radicals as well as for students of advanced courses in physical chemistry, chemical physics, materials science, biophysics, biochemistry and related fields
