Abstract

The monIT project provides public information on population exposure to electromagnetic fields (EMF) from mobile communication systems in Portugal. The monitoring system is based on a network of autonomous remote probing stations, and also on an extensive EMF sounding program, both carried out in public areas across the country. Measured results are automatically uploaded to a Web site for public dissemination (<http://www.bui.pt/monit>), which also includes other relevant information about EMF for the general public. This paper describes the project's structure, the automatic monitoring system, the project's activities, and, finally, it presents a brief analysis of the measured results.

Keywords: Biological effects of electromagnetic radiation; electromagnetic fields; risk analysis; land mobile radio cellular systems; land mobile radio; mobile communication; monitoring

1. Introduction

The monIT Project is being developed within the Instituto de Telecomunicações (IT) Lisbon site at the Instituto Superior Técnico (IST, Technical University of Lisbon, Portugal). This is a nonprofit scientific research and development institute, with activities in the area of telecommunications.

The monIT Project started in 2003, in the context of an urgent general public concern about possible health hazards caused by radiation from mobile-communication-systems antennas. Most of the time this was rooted in misconceptions about the aspects involved, aggravated by the lack of trusted sources of information capable of presenting needed information in a simple, understandable way.

As objective evaluation of the risk requires the quantification of electromagnetic field (EMF) levels to which the population is exposed, systematic information of this type was not openly available in Portugal. This was one of the gaps that the monIT Project filled in, by providing results from extensive measurement campaigns performed in public places, near base stations of mobile communication systems (i.e., GSM and UMTS, without restriction

on the type of cell), over the country for a period that currently amounts to more than three years. The project also produces and disseminates information written in common language to help the clarification of public opinion about relevant aspects of exposure to EMF originated by mobile-communication systems, from an engineering perspective. The dissemination of this information is made through the project's Web site, <http://www.bui.pt/monit>, which is dynamically updated with data from remote monitoring stations and from manual measurement campaigns. The project team is also involved in direct public-information actions, and in basic context for health personnel about the engineering perspective of EMF in mobile communications.

The monIT Project is sponsored by the three mobile operators that are licensed in Portugal (Optimus, TMN, and Vodafone Portugal). However, by contract the sponsors have no intervention with or any form of authority over the project's management, its activities, or the published results.

This paper is organized as follows: The next section presents a general overview of the monIT Project, and the subsequent section is dedicated to the description of the measurement system and protocol. This is followed by a discussion of the measurement results and, finally, some conclusions are drawn.

Haim Mazar,2009 This thesis analyses how and why culture and geography influence the allocation and licensing of the radio frequency RF spectrum in different nations Based on a broad comparative study of 235 countries an inter disciplinary approach is used to explore regulatory frameworks and attitudes toward risk In addition detailed case studies of the UK France the US and Ecuador provide deeper insights into the main contrasting regulatory styles Three alternative sociological theories are used to analyse and explain the results for both the in depth and broad brush studies The Cultural Theory of Mary Douglas and co workers is first used to categorise countries in terms of perceptual filters The empirical findings indicate some countries to be apparently exceptional in their behaviour The theory of Bounded Rationality is used to investigate and explain these apparent irrationalities Finally Rational Field Theory shows how beliefs and values guide administrations in their RF regulation A number of key factors are found to dominate and patterns emerge The European RF harmonisation is unique Following European unification wireless regulation is divided into two major camps the EU and the US which differ in their risk concerns approach to top down mandated standards allocation of RF spectrum to licence exempt bands and type approval process The adoption of 3G cellular UMTS versus CDMA2000 and digital TV standards DVB T ATSC ISDB T around the world reflects geopolitical and colonial influence The language of a country is a significant indicator of its analogue TV standard SECAM PAL NTSC Interestingly the longitude of a country to a fair extent defines RF allocation Africa and West Asia follow Europe whereas the Americas approximate the US RF regulation and risk tolerability differ between tropical and non tropical climates The collectivised centralised versus the individualised market based rationalities result in different regulatory frameworks and contrasting societal and risk concerns The success of the top down European GSM and the bottom up Wi Fi standards reveal how the central planning and market based approaches have thrived Attitudes to RF human hazards and spurious emissions levels reveal that the US Canada and Japan are more tolerant of these radiation risks than Europe Australia Canada New Zealand UK and USA encourage technological innovation A practical benefit of this study is that it will give regulators more freedom to choose a rational RF licensing protocol by better understanding the possibly self imposed boundaries of cultural and geographical factors which are currently shaping allocation Academically there is
