Selected Papers Marston Morse, 2015-10-26 From the Introduction Marston Morse was born in 1892 so that he was 33 years old when in 1925 his paper Relations between the critical points of a real valued function of n independent variables appeared in the Transactions of the American Mathematical Society Thus Morse grew to maturity just at the time when the subject of Analysis Situs was being shaped by such masters as Poincaré Veblen L E J Brouwer G D Birkhoff Lefschetz and Alexander and it was Morse's genius and destiny to discover one of the most beautiful and far reaching relations between this fledgling and Analysis a relation which is now known as Morse Theory In retrospect all great ideas take on a certain simplicity and inevitability partly because they shape the whole subsequent development of the subject And so to us today Morse Theory seems natural and inevitable This whole flight of ideas was of course acclaimed by the mathematical World it eventually earned him practically every honor of the mathematical community over twenty honorary degrees the National Science Medal the Legion of Honor of France

Selected Papers Herbert Robbins, 2012-12-06 Herbert Robbins is widely recognized as one of the most creative and original mathematical statisticians of our time The purpose of this book is to reprint on the occasion of his seventieth birthday some of his most outstanding research In making selections for reprinting we have tried to keep in mind three potential audiences 1 the historian who would like to know Robbins seminal role in stimulating a substantial proportion of current research in mathematical statistics 2 the novice who would like a readable conceptually oriented introduction to these subjects and 3 the expert who would like to have useful reference material in a single collection In many cases the needs of the first two groups can be met simultaneously A distinguishing feature of Robbins research is its daring originality which literally creates new specialties for subsequent generations of statisticians to explore Often these seminal papers are also models of exposition serving to introduce the reader in the simplest possible context to ideas that are important for contemporary research in the field An example is the paper of Robbins and Monroe which initiated the subject of stochastic approximation We have also attempted

to provide some useful guidance to the literature in various subjects by supplying additional references particularly to books and survey articles with some remarks about important developments in these areas

Harmonic Maps: Selected Papers By James Eells And Collaborators James Eells, 1992-08-21 These original research papers written during a period of over a quarter of a century have two main objectives The first is to lay the foundations of the theory of harmonic maps between Riemannian Manifolds and the second to establish various existence and regularity theorems as well as the explicit constructions of such maps

Selected Papers on Algebra and Topology by Garrett Birkhoff J.S. Oliveira, G.-C. Rota, 1987-01-01 The present volume of reprints are what I consider to be my most interesting and influential papers on algebra and topology To tie them together and to place them in context I have supplemented them by a series of brief essays sketching their historical background as I see it In addition to these I have listed some subsequent papers by others which have further developed some of my key ideas The papers on universal algebra lattice theory and general topology collected in the present volume concern ideas which have become familiar to all working mathematicians It may be helpful to make them readily accessible in one volume I have tried in the introduction to each part to state the most significant features of each paper reprinted there and to indicate later developments The background that shaped and stimulated my early work on universal algebra lattice theory and topology may be of some interest As a Harvard undergraduate in 1928-32 I was encouraged to do independent reading and to write an original thesis My tutorial reading included de la Vallee Poussin's beautiful Cours d'Analyse Infinitesimale Hausdorff's Grundzüge der Mengenlehre and Frechet's Espaces Abstraits In addition I discovered Caratheodory's 1912 paper Über das lineare Mass von Punktmengen and Hausdorff's 1919 paper on Dimension und Äusseres Mass and derived much inspiration from them A fragment of my thesis analyzing axiom systems for separable metrizable spaces was later published 2 This background led to the work summarized in Part IV

Euler Through Time V. S. Varadarajan,2006 Euler is one of the greatest and most prolific mathematicians of all time He wrote the first accessible books on calculus created the theory of circular functions and discovered new areas of research such as elliptic integrals the calculus of variations graph theory divergent series and so on

It took hundreds of years for his successors to develop in full the theories he began and some of his themes are still at the center of today's mathematics. It is of great interest therefore to examine his work and its relation to current mathematics. This book attempts to do that. In number theory the discoveries he made empirically would require for their eventual understanding such sophisticated developments as the reciprocity laws and class field theory. His pioneering work on elliptic integrals is the precursor of the modern theory of abelian functions and abelian integrals. His evaluation of zeta and multizeta values is not only a fantastic and exciting story but very relevant to us because they are at the confluence of much research in algebraic geometry and number theory today. Chapters 2 and 3 of the book Anticipating his successors by more than a century Euler created a theory of summation of series that do not converge in the traditional manner. Chapter 5 of the book treats the progression of ideas regarding divergent series from Euler to many parts of modern analysis and quantum physics. The last chapter contains a brief treatment of Euler products. Euler discovered the product formula over the primes for the zeta function as well as for a small number of what are now called Dirichlet L functions. Here the book goes into the development of the theory of such Euler products and the role they play in number theory thus offering the reader a glimpse of current developments the Langlands program.
