Biology and Conservation of Martens, Sables, and Fishers Keith B. Aubry, William J. Zielinski, Martin G. Raphael, Gilbert Proulx, Steven W. Buskirk, 2012-08-28 Mammals in the genus *Martes* are mid-sized carnivores of great importance to forest ecosystems. This book, the successor to *Martens, Sables, and Fishers: Biology and Conservation*, provides a scientific basis for management and conservation efforts designed to maintain or enhance the populations and habitats of *Martes* species throughout the world. The twenty synthesis chapters contained in this book bring together the perspectives and expertise of 63 scientists from twelve countries and are organized by the five key themes of evolution and biogeography, population biology and management, habitat ecology and management, research techniques, and conservation. Recent developments in research technologies such as modeling and genetics, biological knowledge about pathogens and parasites, and concerns about the potential effects of global warming on the distribution and status of *Martes* populations make new syntheses of these areas especially timely. The volume provides an overview of what is known while clarifying initiatives for future research and conservation priorities and will be of interest to mammalogists, resource managers, applied ecologists, and conservation biologists.

Carnivore Ecology and Conservation Luigi Boitani, Roger A. Powell, 2012-01-12 Animals that must hunt and kill for at least part of their living are inherently interesting to many people, and the role that carnivores play in biological communities attracts interest from ecologists and conservation biologists. Conflicts with human activities stimulate continual debates about the management of carnivore populations, and throughout the world people seek workable solutions for human carnivore coexistence. This concise yet authoritative handbook describes research methods and techniques for the study and conservation of all terrestrial carnivore species. Particular attention is paid to techniques for managing the human carnivore interface. Descriptions of the latest methodologies are supported by references to case studies, whilst dedicated boxes are used to illustrate how a technique is applied to a specific land cover type, species, or particular socio-economic context. The book describes the most recent advances in modelling the patterns of animal distributions, movements, and use of land cover types, as well as including the most efficient methods to trap, handle, and mark carnivores. Carnivores are biogeographically diverse, and whilst extensive scientific research has investigated many aspects of carnivore biology, not all species have been equally covered. This book is unique in its intention to provide practical guidance for carrying out research and conservation of carnivores across all species and areas of the world.

Home Ranges of Animals Roger A. Powell, 2025-10-21 Animals have tremendous agency to understand the world around them and to plan how to take best advantage of that world to meet their requirements. Their perception of the world differs from humans and includes knowledge emphasizing different senses. This book argues that to understand animals' home ranges, which are integral to the behavior and ecology of animals, biologists must understand their cognition of their environments. Presenting diverse complementary approaches to studying

home ranges this book shows how using multiple approaches sheds a broad light on how and why animals behave as they do. The book also provides many examples showing how hypothesis driven research provides strong insights into animal behavior and ecology. *Small Carnivores* Emmanuel Do Linh San, Jun J. Sato, Jerrold L. Belant, Michael J. Somers, 2022-07-13. *Small Carnivores: Evolution, Ecology, Behaviour and Conservation*. This book focuses on the 232 species of the mammalian Order Carnivora with an average body mass 21.5 kg. Small carnivores inhabit virtually all of the Earth's ecosystems adopting terrestrial, semi fossorial, semi arboreal or semi aquatic lifestyles. They occupy multiple trophic levels and therefore play important roles in the regulation of ecosystems such as natural pest control, seed dispersal and nutrient cycling. In areas where humans have extirpated large carnivores, small carnivores may become the dominant predators which may increase their abundance, mesopredator release to the point that they can sometimes destabilize communities, drive local extirpations and reduce overall biodiversity. On the other hand, one third of the world's small carnivores are threatened or near threatened with extinction. This results from regionally burgeoning human populations, industrial and agricultural activities causing habitat reduction, destruction, fragmentation and pollution. Overexploitation, persecution and the impacts of introduced predators, competitors and pathogens have also negatively affected many small carnivore species. Although small carnivores have been intensively studied over the past decades, bibliometric studies showed that they have not received the same attention given to large carnivores. Furthermore, there is huge disparity in how research efforts on small carnivores have been distributed with some species intensively studied and others superficially or not at all. This book aims at filling a gap in the scientific literature by elucidating the important roles of and documenting the latest knowledge on the world's small carnivores. This is a book that has been needed for decades. It is the first compendium of recent research on a group of mammals which has received almost no attention before the early 1970s. This book covers a wide range of subdisciplines and techniques and should be considered a solid baseline for further research on this little known group of highly interesting mammals. As our knowledge regarding how ecosystems function increases, then the valuable role of small carnivores and the necessity for their conservation should be regarded as of paramount importance. The topics covered in this book should therefore be of great interest not only to academics and wildlife researchers but also to the interested layman. **Camera Trapping Guide** Janet Pesaturo, 2018-09-01. Using a specially made inexpensive and rugged heat detecting camera, you can view wildlife up close. *Camera Trapping Guide* gives you the trapping techniques and knowledge of animal behaviors so you can get the best possible photos and videos. Includes 37 species common to the eastern U.S. Large and small mammals, squirrels to bears, deer and moose, plus birds and even the American alligator are covered. With photos and range maps, each entry gives details on physical characteristics, tracks and sign, diet, habitat and breeding. Also included are specific camera trapping techniques pertinent to each animal.
