Radiofrequency Catheter Ablation For The Treatment Of Cardiac Arrhythmias:

Radiofrequency Catheter Ablation for Cardiac Arrhythmias, 2002 Catheter ablation is a treatment for patients with heart rhythm disturbances cardiac arrhythmias called tachycardias Tachycardias cause symptoms that degrade the quality of life of individuals and are a life long medical problem Some of them are common medical problems such as atrial fibrillation and many begin at a young age with the potential for life long morbidity Certain tachycardias can be life threatening Drug therapy to control these tachycardias is often ineffective or causes intolerable side effects Presently catheter ablation delivered by radiofrequency energy RFA is the predominant procedure used for the treatment of tachycardias and may be curative or palliative This is the first synthesis of research studies and economic evaluations of RFA in Canada For the following conditions RFA is associated with a high procedural success rate and a low rate of complications within two years of follow up a Paroxysmal supraventricular tachycardia PSVT secondary to an accessory pathway b PSVT secondary to atrioventricular node re entry c Atrial flutter d Focal and re entrant atrial tachycardias For the following conditions catheter ablation is still within the research domain a Atrial fibrillation b Ventricular tachycardia VT in the setting of structural heart disease In adult patients with either symptomatic PSVT or VT patients with implantable defibrillators who experience frequent recurrences RFA is both more effective and less costly than drug therapy options For these patients RFA costs within US 21 000 C 33 000 per quality adjusted life year gained For all the different types of ablation procedures there is a paucity of high quality outcome studies comparing ablation with alternative therapies

online New editor William G Stevenson highly regarded in the EP community brings a fresh perspective to this award winning text Progress in Catheter Ablation Liong Bing Liem,Eugene Downar,2013-11-11 Catheter ablation is widely accepted as an effective and safe form of therapy for cardiac arrhythmia In many instances this curative procedure is considered as the first line of therapy if not the ultimate treatment of choice With the use of radiofrequency RF modality which has revolutionized the technology from a barotraumatic potentially injurious procedure using high voltage direct current DC shock to a safe and relatively painless one catheter ablation procedure now carries a very low risk and is extremely effective for certain types of arrhythmia Its efficacy rate in curing supraventricular tachycardia involving an accessory pathway or dual atrioventricular nodal pathways has been near perfect and its application for certain types of atrial and ventricular arrhythmia have also been very satisfactory However conventional RF ablation has several well known limitations most notably is its ability to only produce relatively small point lesions rendering it effective only for an arrhythmia with a small and or a superficial target It was soon recognized that the technology would not likely to have significant utility in arrhythmia with a more widespread target such as atrial fibrillation or those which involve scarred and deep myocardial tissue such as ventricular tachycardia Indeed the application of conventional RF technology in these complex but common arrhythmia has yielded unsatisfactory results Management of Cardiac Arrhythmias Gan-Xin Yan,Peter R. Fundamental Approaches to the Management of Cardiac Arrhythmias Ruey J. Sung, M.R. Lauer, 2000-10-31 Our purpose in writing this book was to produce a clinically oriented non multi authored textbook of cardiac electrophysiology that would be useful to practicing electro physiologists cardiologists fellows in training as well as associated electrophysiology professionals including nurses and technologists While all clinical textbooks risk be coming outdated even before they re published and few textbooks of a manageable size can claim to be completely comprehensive our goal was to produce a book that systematically presents a thorough discussion of the fundamental principles and concepts important to the practice of clinical electrophysiology We do not discuss basic cellular electrophysiology for its sake alone but instead include basic science material only when it is helpful in explaining the overlying clinical principles Cardiac electrophysiology as with any subspecialty behaves as a living organism with continuous evolution of its standards and practices However even though the details and tools of management catheters drugs devices etc may change with dazzling speed the fundamental principles of diagnosis and management generally change very little and they remain the critical underpinning of the day to day management of patients with cardiac arrhythmias In the first third of the book we present the principles of clinical cardiac electrophysiology as it is currently practiced
